3. DEFINITIONS, ACRONYMS AND ABBREVIATIONS

3.1 Definitions

For the purposes of this Eurocontrol Document, the following definitions shall apply:

3.1.1 Amalgamation: Amalgamation is the process by which tracks from co-operating systems are merged to form an 'amalgamated' track. It is used to smooth any possible differences between the tracks to allow the same amalgamated track information to be served to the users of both systems.

3.1.2 Calculated Item: A piece of information (e.g. the position of a target) derived from raw information through an intermediate processing such as transformation of co-ordinates, tracking, code conversion, etc.

3.1.3 Catalogue of Data Items: List of all the possible Data Items of each Data Category describing the Data Items by their reference, structure, size and units (where applicable).

3.1.4 Data Block: Unit of information seen by the application as a discrete entity by its contents. A Data Block contains one or more Record(s) containing data of the same category.

3.1.5 Data Category: Classification of the data in order to permit inter alia an easy identification.

3.1.6 Data Field: Physical implementation for the purpose of communication of a Data Item, it is associated with a unique Field Reference Number and is the smallest unit of transmitted information.

3.1.7 Data Item: The smallest unit of information in each Data Category.

3.1.8 Measured Item: A piece of information (e.g. the position of a target) directly derived from raw information and transmitted without any smoothing.

3.1.9	**Record:**	A collection of transmitted Data Fields of the same category preceded by a Field Specification field, signalling the presence/absence of the various Data Fields
3.1.10	**State vector:**	A vector describing the state of an object, e.g. position, speed, acceleration…
3.1.11	**Track:**	Time sequence of state vectors of an object estimated by some real time filtering technique using surveillance data as input.
3.1.12	**User Application Profile:**	The mechanism for assigning Data Items to Data Fields, and containing all necessary information which needs to be standardised for the successful encoding and decoding of the messages.

4. GENERAL PRINCIPLES

4.1 General

The transmission of System Track Data shall require the transmission of one type of message, i.e. target reports and flight plan data

4.2 Time Management

The time-stamping shall comply with ICAO Annex 5.

4.3 Projection Systems and Geographical Co-ordinates

4.3.1 Measured Position

The *measured* position is transmitted bias-corrected.

4.3.2 Calculated Position

When the exported calculated position is expressed in a 2D Cartesian co-ordinate system, a projection is performed on a plane tangential to the WGS-84 Ellipsoid at the location of the reference point. The Y-axis points to the geographical north at that position. The X-axis is perpendicular to the Y-axis and points to the east. The X, Y co-ordinates are calculated using a suitable projection technique for the final 3D to 2D conversion (e.g. a stereographical projection). It is slant range corrected, the source of altitude being indicated in I062/080 Track Status, Octet 1, bits-5/3 (SRC).

4.4 Mandatory Items

Data Source Identifier and Service Identification shall be present in every record.

4.5 Unused Bits in Data Items

Decoders of ASTERIX data shall never assume and rely on specific settings of spare or unused bits. However in order to improve the readability of binary dumps of ASTERIX records, it is recommended to set all spare bits to zero.

4.6 User Application Profile and Data Blocks

4.6.1 A single User Application Profile (UAP) is defined and shall be used for System Track Data messages.

4.6.2 Data Blocks shall have the following layout.

CAT = 062	**LEN**	**FSPEC**	Items of the first record	**FSPEC**	Items of the last record

where:

- Data Category (CAT) = 062, is a one-octet field indicating that the Data Block contains System Track Data;
- Length Indicator (LEN) is a two-octet field indicating the total length in octets of the Data Block, including the CAT and LEN fields;
- FSPEC is the Field Specification.

4.7 Composition of messages

4.7.1 Messages shall be composed of Data Items assembled in the order defined by the Field Reference Number (FRN) in the associated UAP.

4.7.2 When sent, items shall always be transmitted in a Record with the corresponding FSPEC bits set to one.

5. LAYOUT OF MESSAGES

5.1 Standard Data Items

The standardised Data Items which shall be used for the transmission of System Track Data are defined in Table 1 and described in the following pages. The column “Encoding rules” indicates what items are mandatory (M) or optional (O) in a record of ASTERIX Cat 062.

NOTES

1. Bit 8 (DUPT) is set to 1 if the correlation between the target report and a flight plan is not possible because the Mode 3/A code stated in the flight plan exists more than once in the surveillance data.
2. Bit 7 (DUPF) - if set to 1 - indicates that for a specific surveillance target more than one flight plan exists which makes correlation impossible.
3. Bit 6 (DUPM) is set to 1 if a target was correlated manually but also a regular flight plan exists.
4. All tracks for which bits 8, 7 or 6 are set to 1 are marked on the CWP.
