

REPORT COMMISSIONED BY THE PERFORMANCE REVIEW COMMISSION

ATM Cost-Effectiveness (ACE) 2014 Benchmarking Report with 2015-2019 outlook

Prepared by the Performance Review Unit (PRU) with the ACE Working Group

BACKGROUND

This report has been commissioned by the Performance Review Commission (PRC).

The PRC was established in 1998 by the Permanent Commission of EUROCONTROL, in accordance with the ECAC Institutional Strategy (1997).

One objective in this Strategy is «to introduce strong, transparent and independent performance review and target setting to facilitate more effective management of the European ATM system, encourage mutual accountability for system performance and provide a better basis for investment analyses and, with reference to existing practice, provide guidelines to States on economic regulation to assist them in carrying out their responsibilities.»

The PRC's website address is http://www.eurocontrol.int/prc

In September 2014, the European Commission extended the designation of the PRC supported by the PRU as the Performance Review Body (PRB) of the Single European Sky (SES) until 31 December 2016.

NOTICE

The Performance Review Unit (PRU) has made every effort to ensure that the information and analysis contained in this document are as accurate and complete as possible. Should you find any errors or inconsistencies we would be grateful if you could please bring them to the PRU's attention.

The PRU's e-mail address is pru@eurocontrol.int

DOCUMENT DESCRIPTION

Document Title

ATM Cost-Effectiveness (ACE) 2014 Benchmarking Report with 2015-2019 outlook

DOCUMENT REFERENCE	EDITION:	EDITION DATE:
ACE 2014	Final report	May 2016

Abstract

This report is the fourteenth in a series of annual reports based on mandatory information disclosure provided by 37 Air Navigation Services Providers (ANSPs) to the EUROCONTROL Performance Review Commission (PRC). This report comprises factual data and analysis on cost-effectiveness and productivity for 37 ANSPs for the year 2014, including high level trend analysis for the years 2009-2014. This year, the ACE report also analyses long-term trends in ANSPs cost-effectiveness performance over the 10-year period 2004-2014. The scope of the report is both en-route and terminal navigation services (i.e. gate-to-gate). The main focus is on the ATM/CNS provision costs as these costs are under the direct control and responsibility of the ANSP. Costs borne by airspace users for less than optimal quality of service are also considered. The report describes a performance framework for the analysis of cost-effectiveness. The framework highlights 3 key performance drivers contributing to cost-effectiveness (productivity, employment costs and support costs). The report also analyses forward-looking information for the years 2015-2019, inferring on future financial cost-effectiveness performance at system level, and displays information on actual and planned capital expenditures.

	European cost-effectiveness performance over a 10-year period between 2004 and 2014.
	These chapters are particularly relevant to ANSPs' management, policy makers, regulators and NSAs in order to identify best practices, areas for improvement, and to understand how cost-effectiveness performance has evolved over time. This information is also useful to support consultation processes between ANSPs and airspace users.
Part II: - Cost-effectiveness performa	ince focus at ANSP level
Chapter 4:	All those who are interested in obtaining an independent and
Focus on ANSPs individual cost- effectiveness performance	comparable analysis of individual ANSP historic performance (2009-2014) in terms of economic and financial cost-effectiveness.
	This chapter is particularly relevant to ANSPs' management, airspace users, regulators and NSAs in order to identify how cost-effectiveness performance has evolved and which have been the sources of improvement. This chapter also includes information on ANSPs historic and planned capital investments, as well as a benchmarking analysis of financial cost-effectiveness with a set of comparators for each ANSP. This information is also useful to support consultation processes between ANSPs and airspace users.
	Tumo
Annexes:	With a view to increase transparency, this report comprises several annexes including the data used in the report. This information is relevant to support cost-benefit analysis of ATM research projects like the SESAR programme. The data comprised in these annexes is also useful to academic researchers for the purposes of empirical analysis.

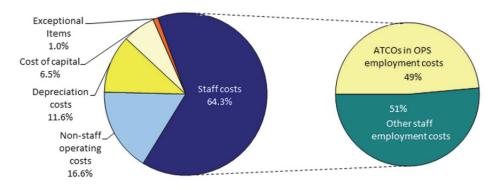

Thits page is left blank intendedically for philating purposess

EXECUTIVE SUMMARY

This ATM Cost-Effectiveness (ACE) 2014 Benchmarking Report, the fourteenth in the series, presents a review and comparison of ATM cost-effectiveness for 37 Air Navigation Service Providers (ANSPs) in Europe. The ACE benchmarking work is carried out by the Performance Review Commission (PRC) supported by the Performance Review Unit (PRU) and is based on information provided by ANSPs in compliance with Decision No. 88 of the Permanent Commission of EUROCONTROL on economic information disclosure and in the context of Annex IV 2.1(a) of EC Regulation N°691/2010 (Performance Scheme) replaced by EC Regulation N°390/2013.

The data processing, analysis and reporting were conducted with the assistance of the ACE Working Group, which comprises representatives from participating ANSPs, airspace users, regulatory authorities and the Performance Review Unit (PRU). This enabled participants to share experiences and gain a common understanding of underlying assumptions and limitations of the data.

From a methodological point of view, the ACE Benchmarking analysis focuses on the specific costs of providing gate-to-gate ATM/CNS services which amounted to €7 945M in 2014. Operating costs (including staff costs, non-staff operating costs and exceptional cost items) account for some 82% of total ATM/CNS provision costs, and capital-related costs (depreciation and cost of capital) amount to some 18%.

Total ATM/CNS provision costs:	€7945 M
--------------------------------	---------

ATM/CNS provision costs (€ M)	En-route	%	Terminal	%	Gate-to-gate	%
Staff costs	3 957	63.7%	1 153	66.4%	5 110	64.3%
ATCOs in OPS employment costs	1 930	-	552	-	2 482	-
Other staff employment costs	2 028	-	601	-	2 629	-
Non-staff operating costs	1 015	16.3%	306	17.6%	1 320	16.6%
Depreciation costs	749	12.1%	170	9.8%	919	11.6%
Cost of capital	426	6.9%	91	5.2%	517	6.5%
Exceptional Items	63	1.0%	16	0.9%	79	1.0%
Total	6 210	100.0%	1 736	100.0%	7 945	100.0%

Figure 0.1: Breakdown of ATM/CNS provision costs in 2014

ACE 2014 presents information on performance indicators relating to the benchmarking of cost-effectiveness and productivity performance for the year 2014, and shows how these indicators changed over time (2009-2014). It examines both individual ANSPs and the Pan-European ATM/CNS system as a whole. In addition, ACE 2014 analyses forward-looking information covering the 2015-2019 period based on information provided by ANSPs in November 2015.

The ACE factual and independent benchmarking sets the foundation for a normative analysis to quantify the potential scope of cost-efficiency improvements for ANSPs. The ACE data analysis and the gathering of business "intelligence" on ANSPs cost-efficiency performance directly feed core processes of the Single European Sky (SES) Performance Scheme.

Executive summary iii

For ANSPs operating in SES States, 2014 is the third year of application of the "determined costs" method which comprises specific risk-sharing arrangements aiming at incentivising ANSPs to better control costs and to improve their economic performance. The PRB released in October 2015 reports on the monitoring of SES performance targets for the last year of RP1 (2014) based on information provided in June 2015. This ACE 2014 Benchmarking Report complements the PRB monitoring activity by providing a detailed benchmarking of cost-effectiveness performance at ANSP level including a trend analysis of three main economic drivers (productivity, employment costs and support costs) over the 2009-2014 period.

For the first time since the start of the ACE benchmarking activity, this report also provides a long-term analysis of the changes in cost-effectiveness and its main drivers between 2004 and 2014. This 10-year period is characterised by significant changes in business cycles, the emergence of a new regulatory framework and technological evolution.

Figure 0.2 shows that during this period, ATM/CNS provision costs rose by +0.4% p.a. which was significantly less than the +1.4% p.a. increase in composite flight-hours, the output metric used in the ACE benchmarking analysis. As a result, unit ATM/CNS provision costs per composite flight-hour decreased by -1.0% p.a. between 2004 and 2014. These average changes mask different trends and cycles over the 10-year period which was marked by a global economic recession in 2009.

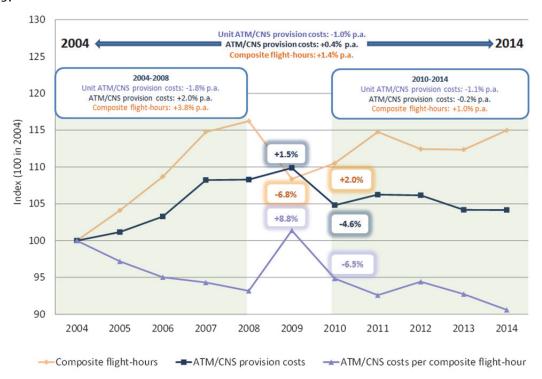

Figure 0.2: Long-term trends in traffic, ATM/CNS provision costs and unit costs

Between 2004 and 2008, a period of sustained traffic growth, the number of composite flight-hours rose faster (+3.8% p.a.) than ATM/CNS provision costs (+2.0% p.a.). As a result, unit ATM/CNS provision costs reduced by -1.8% p.a. over this period. This demonstrated the ability of the ATM industry to reduce unit costs in a context of robust and continuous traffic growth.

Then came the year 2009 which was pivotal for the ATM system. Indeed, the economic recession struck the aviation industry with an unprecedented -6.8% traffic decrease. In the meantime, ATM/CNS provision costs continued to grow by +1.5% reflecting the short-term rigidities to adjust costs downwards and the unavoidable lead time. As a result, unit ATM/CNS provision costs increased by +8.8% and all the cost-effectiveness improvements achieved since 2004 were cancelled out.

However, in 2010, ATM/CNS provision costs reduced by -4.6% in a context of a +2.0% rebound in traffic. It should be emphasised that before 2010, ATM/CNS provision costs had never declined during the decade. This reflects the impact of the cost containment measures implemented by a majority of ANSPs in the wake of the sharp traffic decrease in 2009. This indicates that, as a whole, the ATM industry was reactive and showed flexibility to adjust costs downwards in response to the fall in traffic. This performance improvement was achieved when ANSPs operated under the so-called full-cost recovery regime which provided no strong incentives to reduce or contain costs.

Over the 2010-2014 period, ATM/CNS provision costs remained fairly constant (-0.2% p.a.) in a context of low traffic growth (+1.0% p.a. compared to +3.8% over the 2004-2008 period). As a result, unit ATM/CNS provision costs reduced by -1.1% p.a. between 2010 and 2014. The implementation of the Performance Scheme in 2012 and the financial incentives embedded in the Charging Scheme were important drivers for this improvement since the ANSPs operating in SES States had strong interests in outperforming their cost-efficiency targets, and adapt more rapidly than in the past to traffic fluctuations. It is noteworthy that this performance improvement was achieved while reducing the overall amount of ATFM delays.

Overall, despite the impact of the economic recession on the ATM industry in 2009, the cost-effectiveness performance of the Pan-European system significantly improved since 2004. Indeed, in 2014 unit ATM/CNS provision costs are -9.4% lower than in 2004. This performance improvement should be seen in the light of (a) the cost-containment measures initiated in 2009-2010 which continued to generate savings years after their implementation, and (b) for the ANSPs operating in SES States, the implementation of the Performance Scheme and the incentive mechanism embedded in the charging scheme which contributed to change the economic behaviour of these ANSPs and to maintain a downward pressure on costs during RP1.

Although benchmarking cost-effectiveness is key, looking at costs in isolation of the quality of service is not sufficient. The PRC introduced in its ACE Benchmarking Reports the concept of economic cost-effectiveness indicator in order to better capture the trade-offs between ATC capacity and costs. This indicator is defined as gate-to-gate ATM/CNS provision costs plus the costs of ground ATFM delays for both en-route and airport, all expressed per composite flight-hour. This economic performance indicator is meant to capture trade-offs between ATC capacity and costs.

The analysis of economic cost-effectiveness performance in 2014, the last year of available data, shows that ATM/CNS provision costs remained fairly constant (+0.4% in real terms), while composite flight-hours increased by +2.3%, resulting in a decrease in unit ATM/CNS provision costs (-1.9%). Since the unit costs of ATFM delays increased by +11.4%, unit economic costs slightly reduced by -0.6% compared to 2013. As a result, in 2014 unit economic costs amount to €479 which is the lowest level achieved since the start of the ACE benchmarking analysis in 2001.

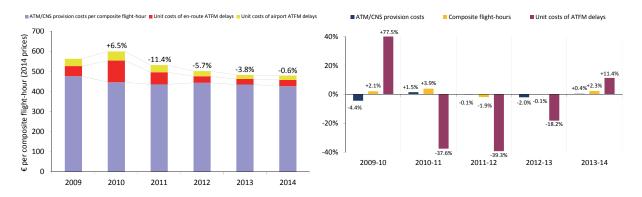

Figure 0.3: Changes in unit economic costs, 2009-2014 (real terms)

In 2014, ATM/CNS provision costs increased for 24 out of 37 ANSPs (see Figure 0.4 below). Although all these ANSPs experienced traffic increases in 2014, only 13 of them were in a position to reduce their unit costs.

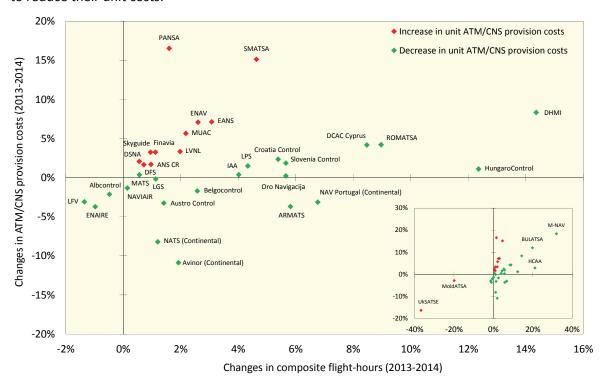

Figure 0.4: Changes in ATM/CNS provision costs and traffic volumes, 2013-2014 (real terms)

It is noteworthy that ATM/CNS provision costs rose by more than +10.0% for four ANSPs including BULATSA (+12.0%), M-NAV (+18.4%), PANSA (+16.5%) and SMATSA (+15.1%). The main drivers for these significant increases are provided in Part I of this report.

Figure 0.4 indicates that in 2014, traffic volumes substantially decreased for UkSATSE (-36.8%) and reductions reflect MoldATSA (-19.9%).These substantial the establishment restricted/prohibited areas in UkSATSE airspace following the accident of Malaysia Airlines flight MH17, military conflicts in the eastern region of Ukraine and the temporary occupation of Crimea. These events led to a transfer of staff and sectors from Simferopol ACC to other regional branches of UkSATSE (mainly Odesa and Dnipropetrovs'k). In addition, UkSATSE lost a number of infrastructure assets that were in operation. In an attempt to adjust to these unfavourable events, UkSATSE reduced its ATM/CNS provision costs by -16.4% mainly through lower staff and non-staff operating costs (-16.8%) and a lower cost of capital (-32.5%).

Figure 0.5 shows that in 2014, ATCO-hour productivity rose faster (+2.0%) than employment costs per ATCO-hour (+1.3%). In the meantime, unit support costs reduced by -2.4% since support costs remained fairly constant (-0.2%) while traffic rose by +2.3%. The combination of these different elements led to the decrease in unit ATM/CNS provision costs observed at Pan-European system level in 2014 (-1.9%).

νi

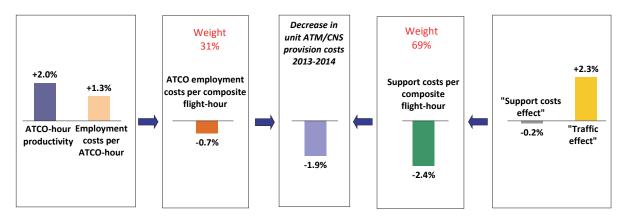

Figure 0.5: Changes in the financial cost-effectiveness indicator, 2013-2014 (real terms)

Figure 0.6 shows the changes in the different components of support costs (see the "support costs effect" bar on the right-hand side of Figure 0.5) between 2013 and 2014.

Support costs remained fairly constant in 2014 (-0.2%). This reflects the fact that higher non-staff operating costs (+1.9% or +€24.1M), depreciation costs (+1.8% or +€16.6M) and cost of capital (+3.6% or +€17.8M), were compensated by lower support staff costs (-1.2% or -€32.6M) and exceptional costs (-30.2% or -€34.2M).

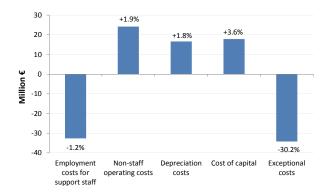

Figure 0.6: Changes in the components of support costs, 2013-2014 (real terms)

Support costs represent some 70% of ATM/CNS provision costs and are therefore an important driver of cost-effectiveness performance. It is expected that in the future, improvements in cost-effectiveness could arise from greater competition for support services which could be available on a central basis, physically distant from the ANSPs HQs and ATC facilities and supported by innovation in IT technology.

At Pan-European system level, after the -1.9% decrease in 2014, gate-to-gate unit ATM/CNS provision costs are expected to rise in 2015 (+1.5%) and then to fall by -2.3% p.a. until 2019.

Overall, gate-to-gate unit ATM/CNS provision costs are expected to reduce by -1.6% p.a. between 2014 and 2019. This mainly reflects the fact that over this period traffic is planned to increase faster (+2.6% p.a.) than ATM/CNS provision costs (+1.0% p.a.).

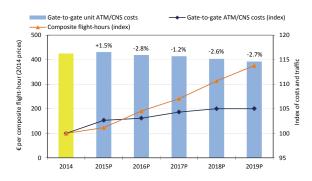

Figure 0.7: Forward-looking costeffectiveness (2014-2019, real terms)

The cumulative capex planned for the period 2015-2019 amounts to some €5 329M or an average of €1 066M per year. Figure 0.8 shows that the average capex to depreciation ratio planned over 2015-2019 (1.17) is in line with that observed over the 2009-2014 period (1.16 excluding NATS). This indicates that, overall, ANSPs asset bases are expected to grow at a similar rate as in the past five years.

Executive summary vii

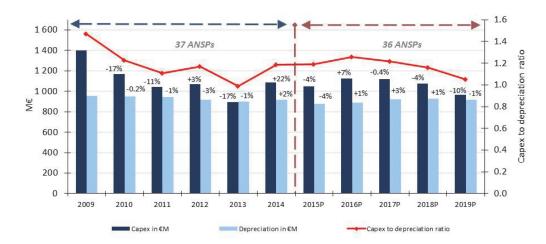

Figure 0.8: Capital expenditures and depreciation costs (2009-2019, real terms)

A more detailed analysis of ANSPs forward-looking plans indicates that a significant proportion of these investments relates to major upgrades or to the replacement of existing ATM systems.

Executive summary viii

1 INTRODUCTION

The Air Traffic Management Cost-Effectiveness (ACE) 2014 Benchmarking Report commissioned by EUROCONTROL's independent Performance Review Commission (PRC) is the fourteenth in a series of reports comparing the ATM cost-effectiveness of EUROCONTROL Member States' Air Navigation Service Providers (ANSPs)¹.

In September 2010, the PRC, supported by the EUROCONTROL Performance Review Unit (PRU), was designated Performance Review Body (PRB) of the European Commission (EC).

The ACE benchmarking work is carried out by the PRC in the context of Articles 3.3(i), 3.6(b)(c), and 3.8 of EC regulation N°691/2010 (Performance Scheme) replaced by EC Regulation N°390/2013.

The report is based on information provided by ANSPs in compliance with Decision No. 88 of the Permanent Commission of EUROCONTROL, which makes annual disclosure of ANS information mandatory, according to the Specification for Economic Information Disclosure² (SEID), in all EUROCONTROL Member States.

Since these services are outside the PRC's terms of reference, this report does not address performance relating to:

- oceanic ANS;
- services provided to military operational air traffic (OAT); or,
- airport (landside) management operations.

The focus of this report is primarily on a cross-sectional analysis of ANSPs for the year 2014. However, the aviation community is also interested in measuring how cost-effectiveness and productivity at the European and ANSP levels vary over time, and in understanding the reasons why variations occur.

Hence, this report makes use of previous years' data from 2009 onwards to examine changes over time, where relevant and valid. It is particularly relevant to have a medium-term perspective given the characteristics of the ANS industry which requires a long lead time to develop ATC capacity and infrastructure. In 2009, the economic recession affected the aviation industry with an unprecedented -7% traffic decrease at system level, basically cancelling three years of traffic growth. It is therefore interesting to look at the changes in performance over the 2009-2014 period to understand how the ATM industry reacted to this sharp decrease in traffic demand. This report also exploits the richness of the ACE data by providing a long term analysis of the changes in cost-effectiveness and its main drivers covering a 10-year period from 2004 to 2014.

1.1 Organisation of the report

The structure of the present ACE 2014 Benchmarking Report is made of two parts and four chapters:

-

¹ Previous reports in the series from ACE 2001 (Sept. 2003) to ACE 2013 (May 2015) can be found on the PRC web site at http://www.eurocontrol.int/articles/prc-and-prb-publications.

² PRC Specification for Economic Information Disclosure - Version 3.0, December 2012, can be found on the PRC web site.

Chapter 1 provides an overview of the participating ANSPs and outlines the processes involved in the production of this report.

Part I and Chapter 2 provide a high level analysis of economic and financial cost-effectiveness performance in 2014 at Pan-European system and ANSP level. This chapter also analyses changes in ATM/CNS cost-effectiveness performance between 2009 and 2014. A particular focus is put on the three main economic drivers of cost-effectiveness (productivity, employment costs and support costs). Chapter 2 also comprises a forward-looking analysis of ATM/CNS performance over the 2015-2019 period, including capital investment projections. Finally, Chapter 3 provides a long-term analysis of the changes in ANSPs cost-effectiveness and its main economic drivers over the 2004-2014 period.

Part II and Chapter 4 provide a two-page summary for each ANSP participating to the ACE programme. This summary includes an individual trend analysis of ANSPs' cost-effectiveness performance between 2009 and 2014, and comprises a benchmarking analysis of each ANSP's financial cost-effectiveness with a set of comparators. It also examines the capital expenditure planned by each ANSP for the period 2015-2019 and how these plans compare to the previous capex cycles.

Finally, this report also comprises several annexes which include statistical data used in the report, and individual ANSP Fact Sheets comprising a factual description of the governance and institutional arrangements in which the ANSP operates.

1.2 Overview of participating ANSPs

In total, 38 ANSPs reported 2014 data in compliance with the requirement from Decision No. 88 of the Permanent Commission of EUROCONTROL. In addition to the EUROCONTROL Member States, the en-route ANSP of Estonia³ provided data in compliance with the Performance Scheme Regulation. All the reported information relates to the calendar year 2014.

Georgia has been integrated into the Multilateral Agreement for Route Charges on the 1st of January 2014. As a result, Sakaeronavigatsia, the Georgian ANSP has submitted for the first time in 2014 data in line with the SEID requirements. This information will be thoroughly validated by the PRU in the first half of 2016 in order to facilitate future data disclosure and to achieve mature data for benchmarking purposes. The objective of this process is to allow a smooth integration of Sakaeronavigatsia in the ACE 2015 benchmarking analysis.

Table 1.1 below shows the list of the ANSPs participating to the ACE 2014 benchmarking analysis, describing both their organisational and corporate arrangements, and the scope of ANS services provided.

_

 $^{^{3}}$ Estonia became a member of EUROCONTROL on the $\mathbf{1}^{\text{st}}$ of January 2015.

States covered by the SES Regulations

States part of the ECAA

States not covered by the SES Regulations

Table 1.1: States and ANSPs participating in ACE 2014

Table 1.1 also indicates (coloured yellow) which ANSPs were at 1 January 2014 part of the SES, and hence subject to relevant SES regulations and obligations. In addition to SES members, a number of States (coloured blue) are committed, following the signature of an agreement relating to the establishment of a European Common Aviation Area (ECAA)⁴, to cooperate in the field of ATM, with a view to extending the SES regulations⁵ to the ECAA States. Hence, in principle all the en-

_

⁴ Decision 2006/682/EC published on 16 October 2006 in the Official Journal of the European Union. States which have signed this Agreement but are not yet EU members comprise the Republic of Albania, Bosnia and Herzegovina, the former Yugoslav Republic of Macedonia, the Republic of Iceland, the Republic of Montenegro, the Kingdom of Norway, and the Republic of Serbia.

⁵ This includes the second package of SES regulations (EC No 1070/2009), the amended Performance Scheme Regulation (EC No 390/2013) and amended Charging Scheme Regulation (EC No 391/2013).

route ANSPs of EUROCONTROL States⁶ and other States disclosing information to the PRC are covered by the SES regulations, except Armenia, Moldova, Turkey and Ukraine.

Table 1.1 also shows the extent to which the ANSPs incur costs relating to services that are not provided by all ANSPs. In order to enhance cost-effectiveness comparison across ANSPs, such costs, relating to oceanic ANS, military operational air traffic (OAT), airport management operations and payment for delegation of ATM services⁷ were excluded to the maximum possible extent.

1.3 Data submission

The SEID (see footnote 2) requires that participating ANSPs submit their information to the PRC/PRU by the 1^{st} of July in the year following the year to which it relates. The SEID became also mandatory as part of the SES II legislation. The ACE 2014 data have been submitted in the SEID Version 3.0 template which is used for the first time in this report.

Version 3.0 of this Specification has been finalised in December 2012 following the formal EUROCONTROL Regulatory and Advisory Framework (ERAF), after consultation and full involvement of the ad-hoc ACE Working Group using lessons learnt from the use of the SEID V2.6 since 2008. The SEID V3.0 also reflects recent developments arising from the second package of the SES regulations in 2009, in particular the Performance Scheme Regulation and the amended Charging Scheme Regulation.

The main change introduced in Version 3.0 compared to Version 2.6 of the SEID (used between 2008 and 2013) relates to the separation of SES and non-SES airports for the reporting of terminal ANS data (revenues, costs, number of staff and traffic). However, the information gathered remains fully compatible with Version 2.6, so that the time series analysed in this report are not affected by the use of Version 3.0.

Figure 1.1 indicates that 18 out of 37 ANSPs provided ACE 2014 data on time by the 1st July 2015. It should be noted that the deadline to provide ACE 2014 data was the 1st July, while it was the 15th July for ACE 2013 data. On the 15th July 2015, 27 ANSPs had submitted their ACE 2014 data submission to the PRU, which is better than for ACE 2013 (23 ANSPs).

It is important that this timely submission of ACE data is sustained and even improved. Robust ACE benchmarking analysis should be available in a timely manner since several stakeholders, most notably ANSPs' management, regulatory authorities (e.g. NSAs) and airspace users, have a keen interest in receiving the information in the ACE reports as early as possible. Clearly, the timescale for the production of the ACE Benchmarking Report is inevitably delayed if data are not submitted on time.

_

⁶ In 2013, en-route ANS in Bosnia and Herzegovina were provided by Croatia Control and SMATSA between FL290 and FL660 but in 2014 there has been a gradual transition phase and in November 2014 the Bosnia and Herzegovina ANSP (BHANSA) was responsible to provide ANS between FL100 and FL325 from Sarajevo ACC. BHANSA is not included in the ACE 2014 analysis but as it is becoming a full-fledged ANSP, it is expected to participate to the ACE benchmarking programme in 2016.

⁷ The column 'Delegated ATM' in Table 1.1 relates to the delegation of ATM services to or from other ANSPs, based on financial agreements.

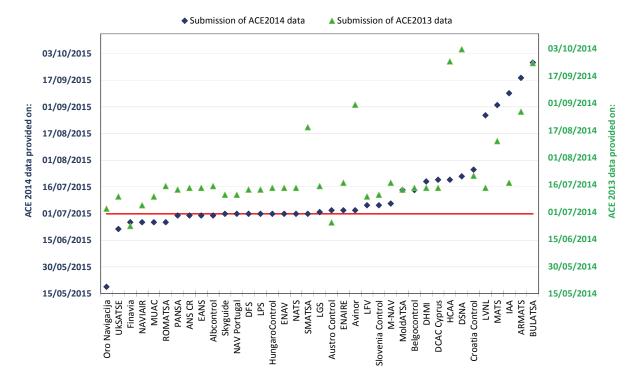

Figure 1.1: Progress with submission of 2014 data

The general and gradual improvement in the quality and the timing of the ACE data submission is marred by some problems relating to few individual ANSPs. For instance, DSNA and HCAA are still not in a position to provide complete balance-sheet data, although capital-related costs are charged to airspace users.

1.4 Data analysis, processing and reporting

The PRU is supported by an ACE Working Group (WG), including ANSPs, regulatory authorities and airspace users' representatives. The process leading to the production of the ACE report, which comprises data analysis and consultation, is summarised in Figure 1.2 below.

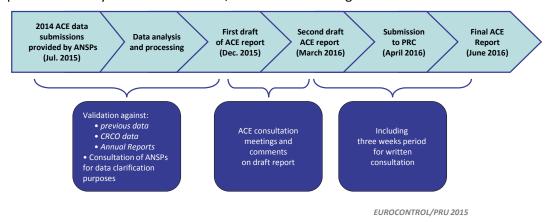

Figure 1.2: Data analysis, processing and reporting

In order to ensure comparability among ANSPs and the quality of the analysis, the information submitted by the ANSPs is subject to a thorough analysis and verification process which makes extensive use of ANSPs' Annual Reports and of their statutory financial accounts.

During this process a number of issues emerged:

- Annual Reports with disclosure of financial accounts are not available for some ANSPs (see Section 1.5 below). This removes one means of validating the financial data submitted.
- ANSPs which are involved in non-ANS activities (such as airport ownership and management, see Table 1.1) do not necessarily disclose separate accounts for their ANS and non-ANS activities. This means that the financial data submitted for the ANS activities cannot be validated with the information provided in the Annual Report.
- Except for a few ANSPs, Annual Reports do not disclose the separate costs for the various segments of ANS (such as en-route and terminal ANS) which means that the cost breakdown provided under the En-route and Terminal columns in the ACE data submissions cannot be fully reconciled.

As ANSPs progressively comply with the SES Regulation on Service Provision, which requires publication of Annual Reports including statutory accounts, and separation of ANS from non-ANS activity in ANSPs internal accounts, some of these shortcomings are expected to be gradually overcome (see also Section 1.5 below).

In most cases, data recorded in the Network Manager (NM) database have been used as the basis for the output metrics used in the ACE data analysis, and this practice has been generally accepted, including in cases where in previous years there had been discrepancies.

1.5 ANSPs' Annual Reports

ANSPs' Annual Reports provided a valuable means of validating the 2014 information disclosure data.

The SES Service Provision Regulation (SPR) (EC No 550/2004) came into force on 20 April 2004 and is applicable to 2014 Financial Accounts in all EU Member States (plus Switzerland and Norway) and to associated ANSPs. This Regulation is also applicable to States which have signed the ECAA Agreement (see Section 1.2), although the timing of its implementation is not yet decided for individual States. Among other provisions, the SPR requires that ANSPs meet certain standards of information disclosure (transparency) and reporting, and in particular that:

- ANSPs should draw up, submit to audit and publish their Financial Accounts (Art.12.1);
- in all cases, ANSPs should publish an Annual Report and regularly undergo an independent audit (Art 12.2); and,
- ANSPs should, in their internal accounting, identify the relevant costs and income for ANS broken down in accordance with EUROCONTROL's principles for establishing the cost-base for route facility charges and the calculation of unit rates and, where appropriate, shall keep consolidated accounts for other, non-air navigation services, as they would be required to do if the services in question were provided by separate undertakings (Art 12.3). The latter requirement is particularly relevant for the ANSPs which are part of an organisation which owns, manages and operates airports, such as Avinor, Finavia, HCAA, and DHMI⁸.

Figure 1.3 displays the status of ANSPs 2014 Annual Reports and indicates that 30 out of 37 participating ANSPs have published an Annual Report for the year 2014.

-

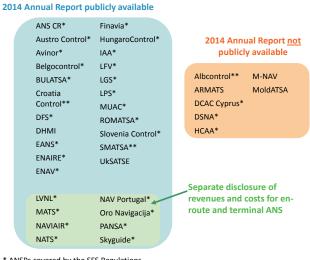

⁸ Although it should be noted that DHMI is not covered by the SES regulations.

It is generally considered that an Annual Report produced according to "best practice" should comprise three main components:

- a Management Report;
- annual Financial Accounts relevant business with segmentation and explanatory notes; and,
- independent Audit Report.

At the time of writing this report, seven ANSPs (including three which are subject to SES Regulations) have not published Annual Reports for 2014.

ANSPs' Annual Accounts are prepared in accordance with specific accounting principles. Often, (national) General Accepted Accounting Principles (GAAP) are used. In the context of the SES, Article 12 of the SPR prescribes that ANSPs Annual Accounts shall comply, to the maximum possible, extent International Financial Reporting Standards (IFRS). Table 1.2 shows the 26 ANSPs whose 2014 Annual Accounts were partly or fully prepared according to IFRS⁹.

- * ANSPs covered by the SES Regulations

Table 1.2: IFRS reporting status

It should be noted that in some cases, the implementation of IFRS may have a significant impact on an ANSPs' cost base 10, 11 (such as different treatment of costs related to the pension scheme, and changes in depreciation rules), hence it is very important to identify and understand the impact of changes in the accounting principles used to draw the financial accounts.

Introduction ACE 2014 Benchmarking Report with 2015-2019 outlook

⁹ Skyguide Annual Accounts are prepared according to the Swiss GAAP which are close to IFRS.

¹⁰ From 2007 onwards, this has been the case for the German ANSP, DFS, whose cost base includes costs recognised only since the conversion to IFRS. These costs, mainly due to the revaluation of DFS pension obligations, have been spread over a period of 15 years.

¹¹ Following the amendment of IAS 19 in 2013, any gains/losses arising from a change in actuarial assumptions have to be directly reflected in financial statements. This contrasts with the methodology that was used by some ANSPs until 2012 (i.e. corridor approach) according to which only a part of the actuarial gains/losses were recognised in the financial statements.

1.6 ANSP benchmarking and the SES Performance Scheme

The SES Performance Scheme includes Union-wide performance targets which are "transposed" into binding national/FAB targets for which clear accountabilities must be assigned within performance plans. Following the PRB recommendations, Union-wide targets for Cost-Efficiency, Capacity and Environment were adopted by the EC on the 3rd December 2010 for RP1 (2012-2014)¹². It should be noted that the Union-wide Cost-Efficiency target is expressed in terms of enroute determined costs per service unit, and is computed at charging zone level (i.e. including ANSPs, MET, EUROCONTROL and NSAs costs).

The ACE factual and independent benchmarking sets the foundation for a normative analysis to quantify the potential scope of cost-efficiency improvements for ANSPs. Findings from the ACE Benchmarking analysis and the gathering of business "intelligence" on ANSPs cost-efficiency performance directly feed three core processes of the SES Performance Scheme:

- 1. Union-wide cost-efficiency target setting;
- 2. assessment of the cost-efficiency part of FABs/National Performance Plans; and,
- 3. monitoring of the cost-efficiency performance during a Reference Period.

For ANSPs operating in SES States, the year 2012 marked the start of RP1 and the end of the "full cost-recovery" mechanism for en-route ANS. Over RP1, SES States/ANSPs operate under the determined costs method which comprises specific risk-sharing arrangements aiming at incentivising ANSPs economic performance. As part of the determined costs method, the costs planned for the reference period (RP) are set in advance and frozen for the length of the RP. If actual costs are lower than the determined costs, then the State/ANSP can keep the difference. On the contrary, if actual costs are higher than determined, then the State/ANSP has to bear a loss. This mechanism provides incentives for States/ANSPs to effectively control their costs and to flexibly adapt to unforeseen changes in traffic volumes.

The three years of RP1 provide meaningful insights on how the industry has reacted to these incentives. The 2014 PRB monitoring report¹³ shows that over RP1 as a whole, actual traffic (in terms of service units) was at Union-wide level -4.9% lower than expected. This report also shows that actual en-route costs were on average -4.1% lower than planned. This result indicates that SES States showed a certain degree of reactivity to adjust costs downwards in order to adapt to the lower traffic volumes than planned over RP1.

This ACE 2014 Benchmarking Report complements the PRB monitoring activity by providing a detailed comparison of cost-effectiveness performance at ANSP level including a trend analysis of three main economic drivers (productivity, employment costs and support costs) over the 2009-2014 period. Performance indicators at FAB level are also presented in Annex 9.

Annex 3 provides explanations on the differences between ACE and SES economic indicators and illustrates how these can be reconciled.

The EC decision (2011/121/EU) setting RP1 performance targets is available at: http://eurlex.europa.eu/LexUriServ/LexUriServ.do?uri=OJ:L:2011:048:0016:0018:EN:PDF.

¹³ This document is available at: http://www.eusinglesky.eu/2014-reports.html.

PART I: PAN-EUROPEAN SYSTEM COST-EFFECTIVENESS PERFORMANCE IN 2014 AND OUTLOOK FOR 2015-2019

Thiles page he left blank Intendentally for philading pumposess

2 PAN-EUROPEAN SYSTEM COST-EFFECTIVENESS PERFORMANCE IN 2014 WITH 2015-2019 OUTLOOK

2.1 Overview of European ANS system data for the year 2014

In 2014, gate-to-gate ATM/CNS provision costs amounted to some €8.0 billion, and the 37 ANSPs employed a total of some 56 300 staff (31% of them being ATCOs working on operational duties).

The Pan-European ANS system analysed in this report comprises 37 participating ANSPs, excluding elements related to services provided to military operational air traffic (OAT), oceanic ANS, and landside airport management operations. The Pan-European ANS system also includes National Supervisory Authorities (NSAs) and other regulatory and governmental authorities, national MET providers and the EUROCONTROL Agency.

In Table 2.1 below, the figures shown for MET costs, EUROCONTROL costs and the payments to national authorities and irrecoverable VAT only represent the costs **passing through ANSPs financial accounts**. This is a smaller scope than in the previous ACE reports where the total ANS costs at State level were displayed, even those not passing through ANSPs' accounts. As a result, the figures shown in Table 2.1 for the year 2013 are not directly comparable with the figures published in the ACE 2013 report. This change reflects the reporting requirements introduced by the SEID V3.0 which focuses on costs passing through ANSPs accounts.

	2013	2014	14/13
	37 ANSPs	37 ANSPs	37 ANSPs
Gate-to-gate ANS revenues (not adjusted by over/under recoveries) (in € M):	8 827	9 143	3.6%
En-route ANS revenues	6 972	7 243	3.9%
Terminal ANS revenues	1 855	1 900	2.4%
Gate-to-gate ATM/CNS provision costs (in € M):	7 914	7 945	0.4%
En-route ATM/CNS costs	6 183	6 210	0.4%
Terminal ATM/CNS costs	1 730	1 736	0.3%
Institutional costs passing through ANSPs accounts (in € M):	766	767	0.2%
MET costs (including internal MET costs)	306	310	1.4%
EUROCONTROL Agency costs	314	304	-3.2%
Payment to national authorities and irrecoverable VAT	147	154	4.9%

NBV of gate-to-gate fixed assets (in € M)	7 350	7 286	-0.9%
Gate-to-gate capex (in € M)	892	1 089	22.1%
Outputs (in M)			
Distance controlled (km)	9 969	10 271	3.0%
Total flight-hours controlled	14.3	14.6	2.6%
ACC flight-hours controlled	12.8	13.1	2.2%
IFR airport movements controlled	14.7	15.0	1.6%
IFR flights controlled	9.4	9.6	1.7%
Gate-to-gate ATFM delays ('000 min.)	8 669	9 881	14.0%

Table 2.1: Key system data for 2013 and 2014, real terms

Table 2.1 above shows that the gate-to-gate ANS revenues amounted to some €9 143M in 2014, which represents an increase of +3.6% compared to 2013. The Pan-European ANSPs employed some 56 303 staff. Overall, at system level each staff generated an average of €162 380 in terms of revenues.

Some 17 513 staff (31%) were ATCOs working on operational duty, split between ACCs (56%) and APP/TWR facilities (44%). On average, 2.2 additional staff are required for every ATCO in OPS in Europe.

ACE also analyses indicators derived from ANSP balance sheets and capital expenditures. The total Net Book Value (NBV) of fixed assets used by the Pan-European ANSPs to provide ATM/CNS services is valued at some €7 286M, which means that overall €0.8 of fixed assets are required to generate €1 of revenue, an indication of relative capital intensity (this ratio is about 2 for airlines and about 3 for main airports operators). Fixed assets mainly relate to ATM/CNS systems and equipment in operation or under construction. In 2014, the total ANSP capex at Pan-European system level amounted to some €1 089M.

Some elements of ANS provision are outside the control of individual ANSPs. These elements include the costs of aeronautical MET services, the costs of the EUROCONTROL Agency and costs associated to regulatory and governmental authorities. Therefore, from a methodological point of view, the ACE Benchmarking analysis focuses on the specific costs of providing gate-to-gate ATM/CNS services which amounted to €7 945M in 2014.

Figure 2.1 shows for each ANS segment the costs distribution between staff costs, non-staff operating costs, depreciation costs, the cost of capital and exceptional costs.

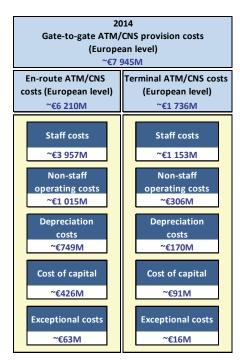

Figure 2.1: Breakdown of ATM/CNS provision costs, 2014

Staff costs are by far the largest costs category (64%), followed by non-staff operating costs (17%), depreciation costs (12%), the cost of capital (7%) and exceptional costs (1%).

Figure 2.1 also shows that gate-to-gate ATM/CNS provision costs can be broken down into enroute and terminal representing respectively 78% and 22% of gate-to-gate costs.

Despite the existence of common general principles, there are inevitably discrepancies in cost-allocation between en-route and terminal ANS across the European ANSPs. This lack of consistency might distort performance comparisons carried out separately for en-route and terminal. For this reason, the focus of the cost-effectiveness benchmarking analysis in this report is "gate-to-gate". For the sake of completeness, Annex 2 of this report provides the breakdown of the gate-to-gate costeffectiveness indicator into en-route and terminal.

ANSPs' ATM/CNS provision costs are then divided by an output metric to obtain a measure of performance – the **financial cost-effectiveness indicator**. The output metric is the composite flight-hour, a "gate-to-gate" measure which combines both en-route flight-hours controlled and IFR airport movements controlled. More information on the calculation of the output metric can be found in Annex 2.

2.2 Factors affecting performance

ANSPs in Europe operate in very diverse environments, both in terms of operational conditions (e.g. traffic complexity and traffic variability) and socio-economic conditions (e.g. cost of living, labour laws).

There are also significant differences in terms of size across the ANSPs since the five largest bear 57% of the total Pan-European ATM/CNS provision costs while the five smallest represent less than 1% of the costs.

Many factors contribute to observed differences in unit costs between ANSPs. Some of these factors are measurable; others (such as regulatory constraints) are less obviously quantifiable.

Methods have been developed by the PRU to measure a subset of exogenous factors. Currently, three relevant factors outside ANSPs control are consistently measured in the ACE Benchmarking Reports. As shown in Figure 2.2 below, these include the traffic complexity and the seasonal traffic variability. The third factor is the cost of living prevailing in the different countries where ANSPs operate.

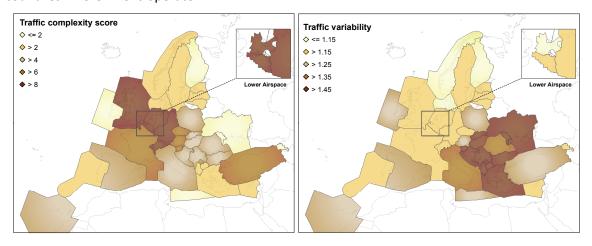

Figure 2.2: Exogenous factors measured by the PRU, 2014

Figure 2.2 shows that traffic complexity scores tends to be very high in the core of Europe (see left-hand map), while the seasonal traffic variability tends to be very high in the South-East corner of Europe (see the right-hand map).

Ideally, since the 37 ANSPs operate in very diverse environments across Europe, all the factors affecting performance should be taken into account in making fair performance comparisons, especially since many of these factors are outside the direct control of an ANSP. As in previous years, the analysis undertaken is a purely **factual** analysis of the cost-effectiveness indicators – measuring what the indicators **are**.

The impact of size on ANSPs performance is an important policy issue given the infrastructure characteristics of the ANS sector and the expectation that fixed costs can be more effectively exploited with larger amounts of traffic.

In 2014, the five largest ANSPs (ENAIRE, DFS, ENAV, NATS and DSNA) bear some 57% of total European gate-to-gate ATM/CNS provision costs, while their share of traffic is 50%. At first this sight, result contrasts with the expectation of some increasing of returns to scale in the provision of ANS (the performance of larger ANSPs might benefit from their larger size).

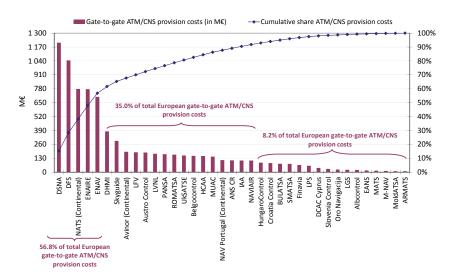

Figure 2.3: Distribution of ATM/CNS provision costs in 2014

However, it should be noted that:

- under the full cost recovery regime that applied to most ANSPs until December 2011, there was little incentive to fully exploit scale effects;
- the five largest ANSPs were substantially affected by the decrease in traffic volumes resulting from the economic recession. On average, the number of composite flight-hours controlled by the five largest ANSPs reduced by -9.6% between 2008 and 2014 while it rose by +7.5% for the other ANSPs;
- larger ANSPs tend to develop bespoke ATM systems internally which can be more costly than commercial off-the-shelf (COTS) solutions; and,
- size is not the only factor that has an impact on ANSPs costs.

It is expected that with the regulatory regime introduced by the SES II Performance Scheme and the incentive scheme embedded in the Charging Scheme regulation, the incentives to exploit scale effects will be stronger in RP2.

2.3 Pan-European economic cost-effectiveness performance in 2014

At Pan-European level, the unit economic costs amounted to €479 in 2014 which is -15% lower than the level achieved before the economic recession (€565 in 2008) and the lowest level since the start of the ACE benchmarking analysis in 2001.

An assessment of ANS performance should take into account the direct provision costs and indirect costs (delays, additional flight time and fuel burn) borne by airspace users, while checking that ANS safety standards are met. The PRC introduced in its ACE Benchmarking Reports the concept of economic cost-effectiveness. This indicator is defined as gate-to-gate ATM/CNS provision costs plus the costs of ground ATFM delays¹⁴ for both en-route and airport,

ue cost of ATFM delays (€100 per minute in 2014, compared to €87 in 2013

¹⁴ The cost of ATFM delays (€100 per minute in 2014, compared to €87 in 2013) is based on the findings of the study "European airline delay cost reference values" realised by the University of Westminster in March 2011 and updated in December 2015. Further details on the computation of the economic costs per composite flight-hour at ANSP and Pan-European system level are available in Annex 2 of this report.

all expressed per composite flight-hour. This economic performance indicator is meant to capture trade-offs between ATC capacity and costs.

Figure 2.4 below shows the comparison of ANSPs gate-to-gate economic cost per composite flight-hour in 2014. The two dotted lines represent the bottom and the top quartiles and provide an indication of the dispersion across ANSPs (there is a difference of €184 between the bottom and the top quartile).

The economic cost-effectiveness indicator at Pan-European level is €479 per composite flighthour, and, on average, ground ATFM delays represent 11% of the total economic costs. According to the Network Operations Report¹⁵, important factors contributing to en-route ATFM delays in 2014 were recurrent capacity issues in Nicosia ACC, industrial actions in France in particular in Bordeaux, Brest and Marseille ACCs¹⁶, and some critical technical failures in Zagreb and London ACCs.

Figure 2.4 below shows that in 2014 unit economic costs ranged from €798 for Belgocontrol to €183 for MATS; a factor of more than four. Figure 2.4 also shows that DFS had the highest unit economic costs amongst the five largest ANSPs.

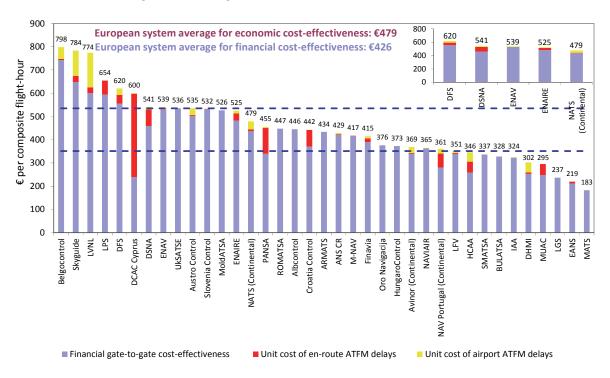

Figure 2.4: Economic gate-to-gate cost-effectiveness indicator, 2014

Figure 2.5 below analyses the changes in economic cost-effectiveness between 2009 and 2014 at Pan-European system level. The left-hand side of Figure 2.5 shows the changes in unit economic costs, while the right-hand side provides complementary information on the year-on-year changes in ATM/CNS provision costs, composite flight-hours and unit costs of ATFM delays.

¹⁵ The Network Operations Report 2014 is available on the Network Manager's website: http://www.eurocontrol.int/publications/annual-network-operations-report-2014

¹⁶ See EUROCONTROL, Network Operations Report 2014, ANNEX II – ACC.

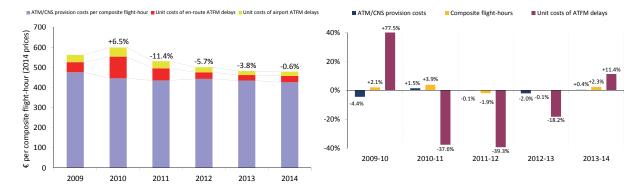

Figure 2.5: Changes in unit economic costs, 2009-2014 (real terms)

The level of the unit economic costs in 2009 reflects the substantial impact of the economic recession on the ATM industry, when composite flight-hours sharply reduced compared to 2008 (an unprecedented decrease of nearly -7%) while ATM/CNS provision costs rose by +1.5%. In 2010, composite flight-hours rose by +2.1% while ATM/CNS provision costs fell by -4.4% in real terms. The reduction in ATM/CNS provision costs reflects the impact of cost-containment measures implemented by several European ANSPs. However, this performance improvement at system level was outweighed by a sharp increase in the unit costs of ATFM delays for a limited number of ANSPs and overall, unit economic costs rose by +6.5% in 2010.

Between 2010 and 2013, economic costs per composite flight-hour decreased by -7.0% p.a. in real terms, mainly due to the substantial decreases in unit ATFM delay costs (-32.3% p.a.). Over this period, ATM/CNS provision costs remained close to their 2010 level (-0.2% p.a.) while the number of composite flight-hours slightly increased (+0.6% p.a.).

In 2014, composite flight-hours rose faster (+2.3%) than ATM/CNS provision costs (+0.4% in real terms), resulting in a decrease in unit ATM/CNS provision costs (-1.9%). Since the unit costs of ATFM delays increased by +11.4%, unit economic costs slightly reduced by -0.6% compared to 2013. As a result, in 2014 unit economic costs amount to €479 which is the lowest level achieved since the start of the ACE benchmarking analysis in 2001.

In Figure 2.6 below, ANSPs are classified in two groups. The upper bar chart shows ANSPs with a relatively higher aggregated complexity score (i.e. higher than 4) while ANSPs with a relatively lower aggregated complexity score (i.e. equal or lower than 4) are shown in the bottom bar chart. Inside each group, ANSPs are ranked by unit economic costs. More information about complexity indicators measured at ANSP level is available in Annex 6.

Figure 2.6 shows that between 2013 and 2014, gate-to-gate economic costs per composite flight-hour fell for 20 ANSPs. Substantial reductions are observed for Austro Control (-13.3%), Avinor (-11.9%), HungaroControl (-10.0%), M-NAV (-10.0%) and NATS (-11.4%). For Austro Control, this reduction is mainly due to a decrease in the unit costs of ATFM delays in 2014 (see red portion of the bar).

On the other hand, Figure 2.6 also shows that unit economic costs rose for 17 ANSPs. For Croatia Control (+9.9%), DHMI (+5.3%), Finavia (+7.9%), LPS (+7.2%), LVNL (+7.7%) and MUAC (+13.7%) the main driver for the increase in unit economic costs is mainly linked to higher ATFM delays.

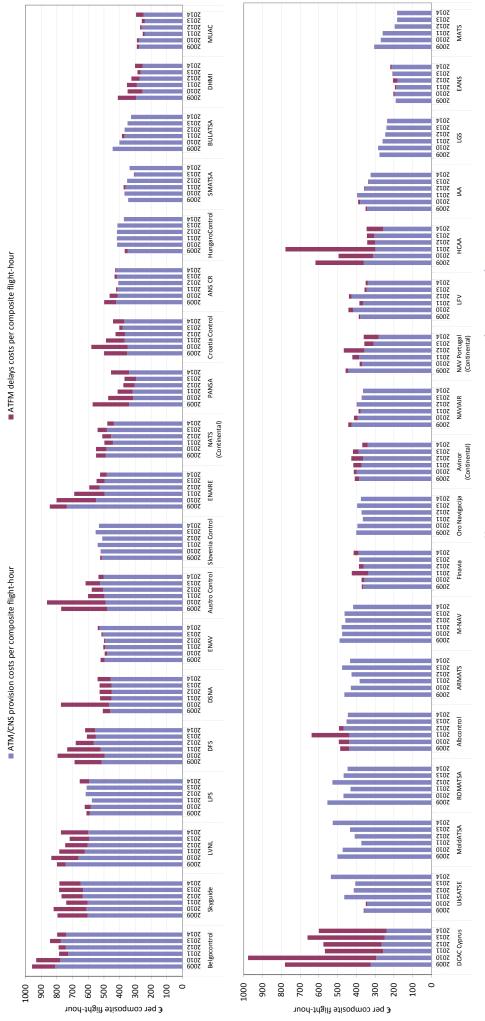

Figure 2.6: Changes in economic cost-effectiveness by ANSP, 2009-2014 (real terms)

Figure 2.7 below shows the contribution of each of the 37 ANSPs to the change in ATFM delays observed in 2014 at Pan-European system level (i.e. increase from 8 669 to 9 881 thousands of minutes).

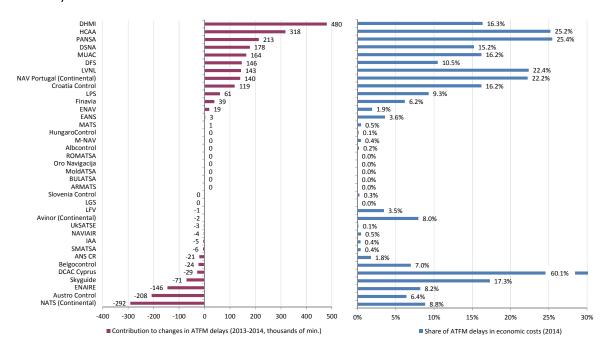

Figure 2.7: ANSPs contribution to ATFM delays increase at Pan-European system level in 2014

Figure 2.7 indicates that the increase in ATFM delays observed at system level in 2014, mainly reflects higher delays for nine ANSPs (DHMI, HCAA, PANSA, DSNA, MUAC, DFS, LVNL, NAV Portugal and Croatia Control). The right-hand side of Figure 2.7 shows that, as a result, for most of these ANSPs the share of ATFM delays in economic costs in 2014 is significantly higher than the European average (11%). This is particularly the case for PANSA (25.4%) and HCAA (25.2%).

For PANSA, the implementation of the new ATM system Pegasus generated exceptional ATFM delays in Warsaw ACC, in particular between May and August 2014. During this period, Warsaw ACC limited all sectors to 85% capacity (119 aircraft per hour instead of 140). The relatively high share of ATFM delays in HCAA economic costs mainly reflects a capacity shortage during the peak summer period between June and September 2014.

Figure 2.7 also indicates that the share of ATFM delays in DCAC Cyprus 2014 unit economic costs (60.1%) is by far the highest in Europe. DCAC Cyprus has had recurrent ATC capacity issues for several years. The implementation of capacity enhancement measures contributed to reduce ATFM delays in 2011-2012 compared to previous years, but the situation deteriorated in 2013 and did not significantly improve in 2014.

More details on the changes in ATFM delays for individual ANSPs are provided in Part II of this Report.

In 2014, unit ATM/CNS provision costs range from €743 (Belgocontrol) to €183 (MATS), a factor of four. Although the five largest ANSPs operate in relatively similar economic and operational environments, there is a substantial variation in unit ATM/CNS provision costs, ranging from DFS (€555) to NATS (€437).

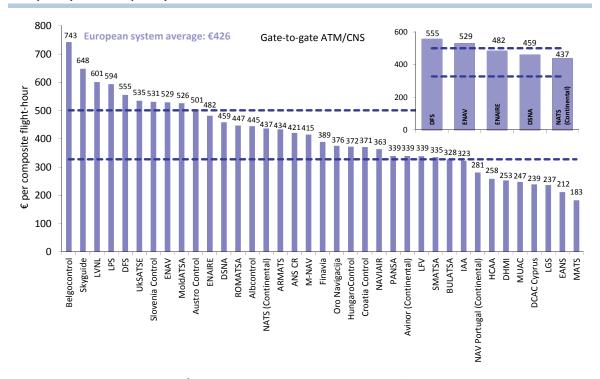

Figure 2.8: ATM/CNS provision costs per composite flight-hour, 2014

Because of their weight in the Pan-European system and their relatively similar operational and economic characteristics (size, scope of service provided, economic conditions, presence of major hubs), the ACE Benchmarking Reports place a particular focus on the results of the five largest ANSPs (ENAIRE, DFS, DSNA, ENAV and NATS).

Figure 2.8 shows that although the five largest ANSPs operate in relatively similar economic and operational environments, there is a substantial difference (27%) in unit ATM/CNS provision costs, ranging from DFS (€555) to NATS (€437). It is important to note that, for ANSPs operating outside the Euro zone, substantial changes of the national currency against the Euro may significantly affect the level of the 2014 unit ATM/CNS provision costs when expressed in Euros.

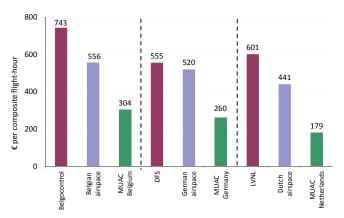

Belgocontrol and LVNL are amongst the ANSPs with the highest unit costs, ranking first and third in Figure 2.8 above. It is noteworthy that although these two ANSPs operate in relatively similar operational (both exclusively provide ATC services in lower airspace) and economic conditions, the unit ATM/CNS provision costs of Belgocontrol are in 2014 some +24% higher than that of LVNL. This substantial difference appears to be mainly driven by Belgocontrol relatively lower ATCO-hour productivity (see Figure 2.16 on p.26) and relatively higher unit support costs (see Figure 2.27 on p.36) compared to LVNL.

It should also be noted that these ANSPs own infrastructure which is made available to MUAC. To better assess the cost-effectiveness of ATM/CNS provided in each of the Four States (Belgium, Germany, the Netherlands, and Luxembourg) national airspaces, MUAC costs and outputs are consolidated with the costs and outputs of the national providers. This adjustment is presented in Figure 2.9 below.

The bottom of Figure 2.9 shows the figures which have been used for this "adjustment". The costs figures are based on the cost allocation keys used to establish the Four States cost-base, while the flight-hours are based on those controlled by MUAC in the three FIRs (Belgium, Netherlands and Germany).

The top of Figure 2.9 provides a view of this consolidated ATM/CNS provision costs per composite flighthour in the airspace of Belgium, the Netherlands and Germany (see blue bars).

After this adjustment, the unit costs in Belgium airspace (€556) remain some 26% higher than in the Dutch airspace (€441).

MUAC	Belgium	Germany	Netherlands
Flight-hours allocated to:	151 866	259 671	175 805
Costs allocated to:	€46.2M	€67.6M	€31.6M

Figure 2.9: Adjustment of the financial cost-effectiveness indicator for ANSPs operating in the Four States airspace, 2014

Figure 2.8 also indicates that in 2014 the unit ATM/CNS provision costs of various ANSPs operating in Central and Eastern European countries (LPS, UkSATSE, Slovenia Control, MoldATSA, ROMATSA, Albcontrol and ARMATS) are higher than the Pan-European system average and in the same order of magnitude as the unit costs of ANSPs operating in Western European countries where the cost of living is much higher.

2.5 Changes in financial cost-effectiveness (2013-2014)

At Pan-European system level, 2014 was a year of traffic recovery (+2.3%) after two years of slight decreases. In the meantime, ATM/CNS provision costs remained fairly constant (+0.4% in real terms), resulting in a -1.9% decrease in unit ATM/CNS provision costs compared to 2013.

Figure 2.10 provides a detailed analysis of the changes in cost-effectiveness at ANSP level between 2013 and 2014, identifying the cost and the traffic effects. It shows that in 2014, ATM/CNS provision costs increased for 24 out of 37 ANSPs (top quadrants of Figure 2.10). Although all these 24 ANSPs experienced traffic increases in 2014, only 13 could reduce unit costs (see the green dots on the top right quadrant of Figure 2.10).

ATM/CNS provision costs decreased for 13 out of 37 ANSPs compared to 2013 (bottom quadrants of Figure 2.10). Two of these ANSPs experienced a sharp traffic decrease: UkSATSE (-36.8%) and MoldATSA (-19.9%).

For UkSATSE, the -36.8% decrease in traffic reflects the establishment of restricted/prohibited areas in UkSATSE airspace following the accident of Malaysia Airlines flight MH17 and military conflicts in the Eastern region of Ukraine (Crimea). These events led to a transfer of staff and sectors from Simferopol ACC to other regional branches of UkSATSE (mainly Odesa and Dnipropetrovs'k). In addition, UkSATSE lost a number of infrastructure assets that were in operation. In an attempt to adjust to these unfavourable events, UkSATSE reduced its ATM/CNS

provision costs by -16.4% in 2014 mainly through lower staff and non-staff operating costs (-16.8%) and a lower cost of capital (-32.5%).

MoldATSA traffic was also adversely affected by the situation in Ukraine with a -19.9% decrease. Since ATM/CNS provision costs reduced by -2.9%, MoldATSA unit costs¹⁷ rose by +21.2% in 2014.

In 2014, Avinor ATM/CNS provision costs fell by -10.9%. It is understood that this decrease is mainly due to reductions in staff costs (-14.6%) following a decrease in staff numbers (-5.0%), the implementation of a new methodology to allocate staff and other operating costs, and the presence of exceptional staff costs in 2013 (due to the implementation of IAS 19 and negotiations with unions in 2013 following operational difficulties during the summer 2012).

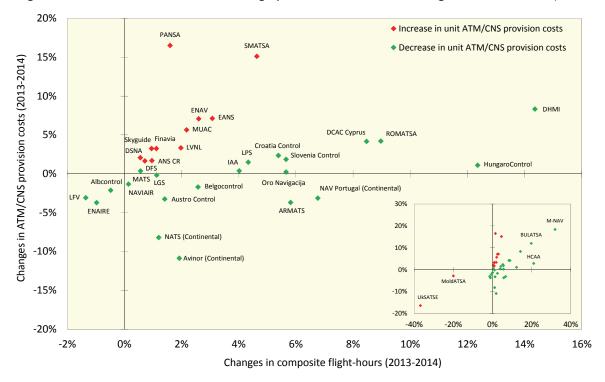

Figure 2.10: Changes in ATM/CNS provision costs and traffic volumes, 2013-2014 (real terms)

On the other hand, it is noteworthy that ATM/CNS provision costs rose by more than +10.0% for four ANSPs including BULATSA (+12.0%), M-NAV (+18.4%), PANSA (+16.5%) and SMATSA (+15.1%).

- In the case of BULATSA, the primary driver for the observed increase are higher staff costs (+14.1%), non-staff operating costs (+11.4%) and cost of capital (+15.9%) while depreciation costs decreased (-4.1%). The increase in BULATSA ATM/CNS provision costs should be seen in the context of a substantial traffic increase (+19.8%) reflecting a change in traffic flows following the establishment of restricted/prohibited areas in Ukraine.
- For M-NAV, the increase in ATM/CNS provision costs is mainly due to higher staff costs (+7.0%), non-staff operating costs (+34.6%, mainly reflecting higher maintenance costs) and to the reporting of exceptional costs (€0.8M) relating to a provision for bad debts. As for BULATSA, the increase in M-NAV ATM/CNS provision costs should be seen in the

¹⁷ It is important to note that although MoldATSA reported the cost of capital in its ACE 2014 data submission, this item has not been entirely charged to airspace users in order to mitigate the impact of lower traffic on the unit rate.

- context of a substantial traffic increase (+32.0%) reflecting a change in traffic flows following the establishment of restricted/prohibited areas in Ukraine.
- For PANSA, ATM/CNS provision costs rose mainly because of higher staff costs (+5.1%) and non-staff operating costs (+127.0%) while the cost of capital decreased (-78.0%). It is understood that the large increase in non-staff operating costs (+€22M) mainly relates to the reporting of a provision reflecting a financial compensation for the non-contractual use of a land.
- In the case of SMATSA, the main drivers of the observed increase in ATM/CNS provision costs are higher staff costs (+11.5%, from a level in 2013 which was relatively low due to the application of austerity measures), non-staff operating costs (+32.7%, mainly due to higher currency exchange losses) and cost of capital (+23.1%, mainly reflecting an increase in the weighted average cost of capital).

Among the five largest ANSPs, ENAIRE (-3.7%) and NATS (-8.2%) could achieve a significant reduction in ATM/CNS provision costs in 2014. These reductions were achieved in the context of a traffic decrease for ENAIRE (-1.0%) and a traffic increase for NATS (+1.2%). As a result, unit ATM/CNS provision costs reduced for these two ANSPs in 2014 (-2.8% for ENAIRE and -9.3% for NATS). On the other hand, for DSNA, DFS and ENAV, ATM/CNS provision costs increased faster than traffic leading to an increase in unit costs (+1.5%, +0.7% and +4.4%, respectively).

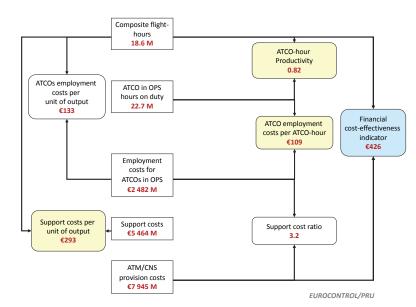

- For ENAIRE, the observed decrease in ATM/CNS provision costs in 2014 (-3.7%) reflects reductions in all cost categories, with particularly large decreases in non-staff operating costs¹⁸ (-13.2% or -€12.3M, mainly reflecting the austerity policy adopted in previous years) and in the cost of capital (-19.7% or -€11.6M, due to the application of lower return on equity and interest rate on debt in 2014).
- In the case of NATS, total ATM/CNS provision costs fell by -8.2% between 2013 and 2014, mainly because an amount of €53M was reported in 2013 as exceptional costs (mainly redundancy costs). Reductions in non-staff operating costs (-10.6% or -€15.7M) were also an important factor contributing to the overall decrease in NATS ATM/CNS provision costs.
- For DFS, ATM/CNS provision costs rose by +1.7% between 2013 and 2014, mainly due to increases in staff costs (+1.0% or +€7.3M, despite a -2.5% decrease in total staff) and in the cost of capital (+12.8% or +€9.3M, which reflects a significant increase in DFS asset base).
- For ENAV, despite a +2.6% traffic growth in 2014, unit ATM/CNS provision costs rose by +4.4% as costs increased by +7.1%. All cost categories (except exceptional costs) increased in 2014. The largest increases are observed for the staff costs (+3.5% or +€12.5M), the non-staff operating costs (+7.1% or +€10.0M) and the cost of capital (+50.6% or +€19.3M).
- For DSNA, ATM/CNS provision costs rose by +2.1% reflecting increases in all cost categories except staff costs which reduced by -0.9% (or -€7.4M). The largest increases are observed for the non-staff operating costs (+7.1% or +€15.7M), the depreciation costs (+4.4% or +€4.8M) and the cost of capital (+31.5% or +€11.4M).

More details on the changes in unit ATM/CNS provision costs for individual ANSPs are provided in Part II of this Report.

-

¹⁸ ENAIRE 2014 ATM/CNS provision costs comprise costs relating to ATM/CNS infrastructure shared with the military authority (€16.1m), which are charged to civil airspace users. It should be noted that these costs, which are borne by Spanish military authority, are not passing through ENAIRE accounts from 2014 onwards.

Figure 2.11 shows the analytical framework which is used in the ACE analysis to break down the financial cost-effectiveness indicator into basic economic drivers.

Key drivers for the financial cost-effectiveness performance include:

- a) ATCO-hour productivity (0.82 composite flight-hours per ATCO-hour);
- b) ATCO employment costs per ATCO-hour (€109); and,
- c) support costs per unit output (€293).

These three economic drivers are analysed in details in the next Sections of this document.

Figure 2.11: ACE performance framework, 2014

Around 30% of ATM/CNS provision costs directly relates to ATCOs in OPS employment costs while 70% relate to "support" functions including non-ATCOs in OPS employment costs, non-staff operating costs and capital-related costs such as depreciation costs and the cost of capital.

Figure 2.12 shows that in 2014, ATCO-hour productivity rose faster (+2.0%) than employment costs per ATCO-hour (+1.3%) and as a result ATCO employment costs per composite flight-hour decreased by -0.7%. In the meantime, unit support costs reduced by -2.4% since support costs remained fairly constant (-0.2%) while the number of composite flight-hours rose by +2.3%. The combination of these different elements led to the decrease in unit ATM/CNS provision costs observed at Pan-European system level in 2014 (-1.9%).

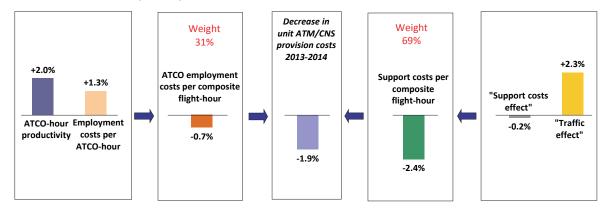

Figure 2.12: Changes in the financial cost-effectiveness indicator, 2013-2014 (real terms)

A detailed analysis of the changes in the key drivers of cost-effectiveness between 2009 and 2014 is provided hereafter (see sections 2.6, 2.7 and 2.8 below).

At Pan-European level, an average of 0.82 composite flight-hour was controlled per ATCO-hour in 2014. ATCO-hour productivity rose by +13.1% between 2009 and 2014 since the increase in traffic (+6.4%) was absorbed with substantially fewer ATCO-hours on duty (-5.9%).

Figure 2.13 indicates that starting from a relatively low base in 2009 (reflecting the fall in traffic which resulted from the economic recession), ATCO-hour productivity substantially increased for two consecutive years (+6.7% in 2010 and +2.9% in 2011), remained fairly constant in 2012 (+0.1%) and then rose again in 2013 (+0.9%) and 2014 (+2.0%). The productivity increase in 2014 benefited from the +2.3% traffic growth while ATCO-hours on duty remained fairly constant (+0.3%).

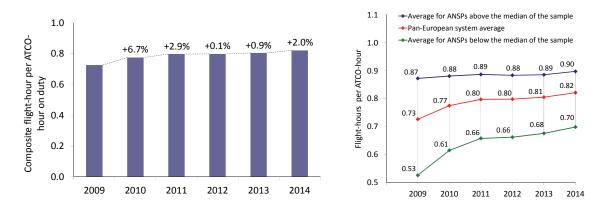

Figure 2.13: Changes in ATCO-hour productivity, 2009-2014

The increase in ATCO-hour productivity observed at Pan-European system level over the 2009-2014 period mainly reflects improvements in ANSPs starting in 2009 with relatively lower ATCO-hour productivity levels (see green line in the right-hand chart of Figure 2.13), while lower increases are observed for ANSPs starting in 2009 with higher productivity levels (see blue line in the right-hand chart of Figure 2.13).

Strong productivity increases were mainly achieved by Central and Eastern Europe ANSPs benefiting from higher traffic growth. However, significant improvements in productivity were also achieved by some ANSPs which started from a relatively higher base in 2009 (e.g. IAA, +24.0% and NAV Portugal, +8.4%).

At Pan-European system level, the increase in productivity achieved between 2009 and 2014 (+13.1%) is due to the fact that the overall traffic increase (+6.4%) was absorbed with substantially fewer ATCO-hours on duty (-5.9%). This result indicates that the organisation of rosters and working conditions are key aspects to manage ATCO-hour productivity performance.

Figure 2.14 shows that after a sharp reduction (-4.4%) due to lower overtime hours between 2009 and 2010, average ATCO-hours on duty continued to fall by -1.9% p.a. between 2010 and 2013 and then slightly rose in 2014 (+0.5%). These results are heavily influenced by the structural changes implemented in 2010-2011 by ENAIRE (at the time Aena) following the introduction of Law 9/2010 which was adopted in Spain in 2010.

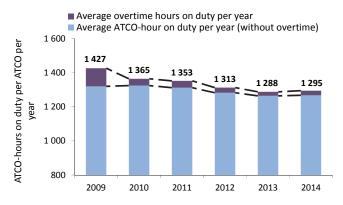

Figure 2.14: Changes in average ATCO-hours on duty, 2009-2014

This law introduced new working conditions for Spanish ATCOs, rising contractual working hours and significantly reducing the number of overtime hours, which was one of the main driver for high ATCO employment costs and relatively lower productivity for ENAIRE in the past. Indeed, between 2009 and 2014, ENAIRE ATCO-hour productivity substantially increased from 0.52 to 0.79 (+50.8%).

In order to understand the factors underlying ATCO-hour productivity changes between 2013 and 2014, the change in each ANSP's productivity indicator has been broken down in Figure 2.15 below, into a traffic volume effect and an ATCO-hours effect.

	(A)	(B)	(C)
ANSPs	Changes in ATCO- hour productivity 2013-2014	"Traffic effect"	"ATCO-hour effect"
M-NAV	33.0%	32.0%	-0.8%
BULATSA	16.7%	19.8%	2.7%
LPS	13.6%	4.3%	-8.1%
ROMATSA	12.2%	9.0%	-2.9%
Albcontrol	11.8%	-0.5%	-11.0%
HungaroControl	9.9%	12.4%	2.3%
ARMATS	9.3%	5.8%	-3.2%
DCAC Cyprus	8.0%	8.5%	0.5%
DHMI	7.8%	14.4%	6.1%
Slovenia Control	7.4%	5.7%	-1.6%
LFV	6.3%	-1.3%	-7.2%
ENAV	5.2%	2.6%	-2.5%
Oro Navigacija	4.3%	5.7%	1.3%
IAA	4.0%	4.0%	0.0%
Finavia	4.0%	1.1%	-2.8%
NAV Portugal (Continental)	3.9%	6.8%	2.8%
DFS	2.6%	1.0%	-1.6%
NATS (Continental)	2.4%	1.2%	-1.2%
Austro Control	2.0%	1.4%	-0.6%
Avinor (Continental)	1.9%	1.9%	0.0%
HCAA	1.2%	21.1%	9.6%
Belgocontrol	0.6%	2.6%	2.0%
Skyguide	0.1%	1.0%	0.8%
SMATSA	0.1%	4.6%	4.6%
ANS CR	-0.1%	0.7%	0.9%
ENAIRE	-0.2%	-1.0%	-0.8%
EANS	-1.1%	3.1%	4.2%
DSNA	-1.2%	0.6%	1.8%
MUAC	-1.6%	2.2%	3.8%
PANSA	-1.9%	1.6%	3.5%
NAVIAIR	-3.0%	0.1%	3.3%
LVNL	-3.3%	2.0%	5.5%
Croatia Control	-4.3%	5.4%	10.2%
MATS	-17.3%	0.6%	21.6%
LGS	-19.3%	1.1%	25.3%
UkSATSE	-25.0%	-36.8%	-15.7%
MoldATSA	-33.5%	-19.9%	20.5%
Total Pan-European System	2.0%	2.3%	0.3%

<u>Positive</u> values in column (A) mean that productivity <u>improved</u> between 2013 and 2014.

<u>Positive</u> values in column (B) mean that traffic volumes <u>rose</u> between 2013 and 2014.

<u>Positive</u> values in column (C) mean that the number of ATCO-hours <u>rose</u> between 2013 and 2014. All other things being equal, a positive value contributes to lower productivity (hence the red dot).

<u>Productivity improves</u> if traffic grows faster than the ATCO-hours on duty.

<u>For example:</u> LPS's 2014 productivity is +13.6% higher than in 2013 due a combination of a +4.3% increase in traffic and a -8.1% decrease in the number of ATCO-hours.

Note: By mathematical construction, the % variation in productivity (A) can be approximated as the difference between the "traffic effect" (B) and the "ATCOhour effect" (C). The larger the % variations, the less accurate the approximation. This explains why in some cases (A) is not exactly equal to (B) - (C).

Figure 2.15: Annual changes in ATCO-hour productivity, composite flight-hours and ATCO-hours on duty, 2013-2014

This table suggests that the largest increases in productivity are likely to arise from serving increased traffic with the same or a reduced number of ATCOs, although in some of the cases the number of ATCO-hours has risen, but not as fast as traffic growth.

Changes in ATCOs in OPS hours on duty could arise from:

- Changes in the number of FTE ATCOs in OPS (caused by such factors as newly licensed ATCOs, normal retirement, activation of an early retirement scheme);
- Changes in the number of hours on duty, through:
 - Modification of the contractual working hours following a new labour agreement;

- Changes in the number of hours not on duty (for example, through an increase in average sickness or in refresher training time); or,
- Changes in overtime (where applicable).

In 2014, the ATCO-hour productivity of the Pan-European system as a whole amounted to 0.82 composite flight-hours per ATCO-hour. It is important to note that the metric of ATCO-hour productivity used in this report reflects the average productivity during a year for a given ANSP and does not give an indication of the productivity at peak times which can be substantially higher. The ATCO-hour productivity in 2014 for each ANSP is shown in Figure 2.16 below.

There is a wide range of ATCO-hour productivity among ANSPs. The ANSP with the highest ATCO-hour productivity is MUAC (1.96), which only provides ATC services in upper airspace, while the ANSP with the lowest ATCO-hour productivity is ARMATS (0.17), i.e. one of the smallest ANSPs in terms of traffic volumes.

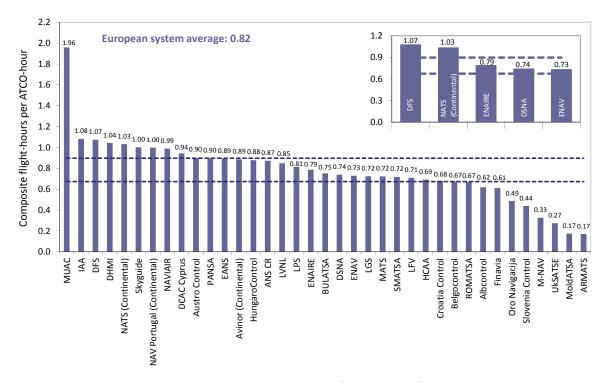

Figure 2.16: ATCO-hour productivity (gate-to-gate), 2014

Figure 2.16 also indicates that there are substantial differences in ATCO-hour productivity even among the five largest ANSPs. Indeed, DFS ATCO-hour productivity (1.07) is some +47.4% higher than that of ENAV (0.73).

It is important to mention that significant gains in cost-effectiveness could be achieved if the European average productivity (0.82) was raised to the level of the top quartile in Figure 2.16 (0.90). Most of the ANSPs that achieve or are close to top quartile ATCO-hour productivity (Austro Control, ANS CR, DFS, MUAC, NATS and Skyguide) are among the ANSPs with the most complex traffic. On the other hand, ARMATS, M-NAV, MoldATSA and UkSATSE, which belong to the ANSPs with the least complex traffic (see Figure 2.2) show an ATCO-hour productivity which is lower than the bottom quartile. Low productivity in some of these ANSPs may be a consequence of their small size, and the difficulty in adapting their available ATC capacity and existing infrastructure to low traffic volumes and high seasonal variability. In the case of MoldATSA and UkSATSE, the very large traffic decreases experienced in 2014 (-19.9% and -36.8%, respectively) had a massive adverse impact on ATCO productivity.

Improvements in ATCO-hour productivity can result from more effective OPS room management and by making a better use of existing resources, for example through the adaptation of rosters (preferably individually-based to enhance flexibility) and shift times, effective management of

overtime, and through the adaptation of sector opening times to traffic demand patterns. Similarly, advanced ATM system functionalities and procedures are drivers for productivity improvements. It is also expected that SES tools such as FABs, the Network Manager, the Performance Scheme and the technological pillar (SESAR) contribute to increase ATCO productivity by a significant factor while ensuring safety standards.

Latest forecasts indicate that traffic volumes are not expected to be above 2008 levels before 2017¹⁹. For this reason, there should be an opportunity to maintain the overall amount of ATCO-hours at Pan-European system level and, all else equal, increase ATCO-hour productivity without significantly affecting the quality of service provided and without implementing massive investment programmes.

More details on the changes in ATCO-hour productivity for individual ANSPs are provided in Part II of this Report.

ATCO-hour productivity measured at ANSP level reflects an average performance, which can hide large differences among ACCs even for those operating in the same country/ANSP. It is therefore important to also analyse and compare productivity at ACC level.

In Figure 2.17, the 62 ACCs for which ACE 2014 data were reported are grouped in clusters based on three operational characteristics: (1) their complexity scores, (2) the average used flight levels, and (3) their number of sectors. More information on the definition of these clusters can be found in previous ACE reports²⁰.

Compared to the ACE 2013 Benchmarking Report, Simferopol ACC has been excluded from this analysis since operations in Simferopol ACC stopped in April 2014 due to the temporary occupation of Crimea. On the other hand, it should be noted that the figures reported for Budapest ACC comprise data relating to the Kosovo Force (KFOR) sector which is operated by HungaroControl since April 2014.

So far, no clear-cut statistical relationship between ATCO productivity, traffic complexity and traffic variability could be inferred because the relationships and potential trade-offs between all these metrics are not straightforward. Nevertheless, it is useful to compare the ATCO productivity of ACCs that share similar "operational" characteristics. Each cluster is briefly described below:

- Cluster 1 (ACCs serving predominantly lower airspace with relatively high structural complexity) has the second lowest average productivity of the four clusters (0.77 flight-hour per ATCO-hour). Palma, with the lowest productivity, has one of the highest seasonal traffic variability in Cluster 1.
- Cluster 2 (ACCs serving dense upper airspace) has an average productivity of 1.20 flight-hour per ATCO-hour. Within this cluster, Maastricht has significantly higher productivity (1.96 flight-hours per ATCO-hour, some +64% above the average in Cluster 2). When excluding Maastricht and Karlsruhe ACCs which exclusively provide ATC services in upper airspace, the average cluster productivity falls to 1.00.

_

¹⁹ According to EUROCONTROL Seven Year Forecast published in February 2016, the number of IFR flights in the ESRA08 region is planned to reach 10.2 million in 2017 compared to 10.1 million in 2008.

See for example the ACE 2008 Benchmarking Report on p.104. Report available on the PRC website: (http://www.eurocontrol.int/articles/prc-and-prb-publications).

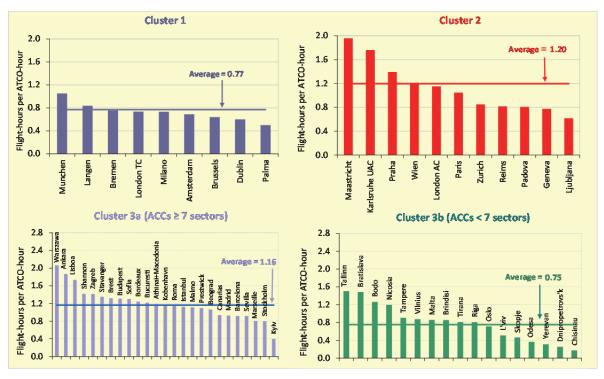

Figure 2.17: Summary of productivity results at ACC level, 2014

- Cluster 3a (ACCs with 7 sectors or more and serving airspace with relatively low complexity) has an average productivity of 1.16 flight-hour per ATCO-hour. Within this cluster, Warszawa has higher productivity (2.07 flight-hours per ATCO-hour). It should also be noted that within this cluster Brest, Bordeaux and Marseille have the highest overall complexity, while Kyiv and Shannon have the lowest.
- Cluster 3b (ACCs with less than 7 sectors serving airspace with relatively low complexity) has an average productivity of 0.75 flight-hour per ATCO-hour. It is important to note that Chisinau ACC, which has the lowest ATCO-hour productivity, experienced a -32.8% decrease in flight-hours controlled between 2013 and 2014 due to changes in traffic flows following the closure of a part of airspace over Ukraine.

The analysis of ATCO-hour productivity at ACC level would seem to indicate that, whilst complexity measures are helpful in providing a way of clustering ACCs into broadly consistent groups, within these clusters there are still large differences in productivity performance across individual ACCs.

Other factors as yet unidentified (and not measured) such as the impact of different operational concepts and processes, the operational flexibility, could also affect ATCO productivity performance. There may also be cultural and managerial differences. These elements would deserve further analysis in order to provide some "explanation" of the differences in ATCO-productivity and identify best practice.

2.7 ATCO employment costs

At Pan-European system level, ATCO employment costs per ATCO-hour slightly increased between 2009 and 2014 (+0.7%).

Figure 2.18 shows that this is driven by:

- a significant decrease for the year 2010 (-5.3%); and,
- increases in each year between 2011 and 2014.

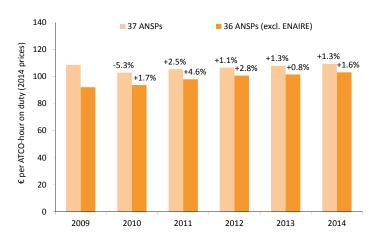

Figure 2.18: Changes in ATCO employment costs per ATCOhour, 2009-2014 (real terms)

Figure 2.18 shows that this overall change is significantly affected by the decrease in ENAIRE ATCO employment costs over the years 2009 and 2010. Indeed, excluding ENAIRE, ATCO employment costs per ATCO-hour have increased in real terms by +12.0% between 2009 and 2014 (equivalent to +2.3% p.a.).

In 2014, ATCO employment costs per ATCO-hour rose for 25 out of the 37 ANSPs. Increases larger than +15% were observed for six ANSPs: Albcontrol (+27.8%, from €35 to €45), ARMATS (+19.4%, from €10 to €12), BULATSA (+29.5%, from €52 to €67), M-NAV (+19.9%, from €32 to €38), MoldATSA (+42.5%, from €18 to €26) and ROMATSA (+16.9%, from €74 to €87).

Among the five largest ANSPs, the most noticeable increases in ATCO employment costs per ATCO-hour between 2013 and 2014 were observed for DFS (+8.4%, from €182 to €197) and NATS (+5.9%, from €126 to €133) reflecting a combination of higher ATCO employment costs with lower ATCO-hours on duty. Smaller increases were observed for DSNA (+1.1%, from €98 to €99), ENAIRE (+0.2%, from €172 to €173) and ENAV (+1.4%, from €111 to €112). As a result, the gap observed between DFS (€197) and DSNA (€99) increased in 2014, reaching a factor of 1.99 (compared to 1.85 in 2013).

In 2014, the largest decreases in employment costs per ATCO-hour were observed for HCAA (-38.3% from €77 to €48), LGS (-19.9% from €43 to €35), MATS (-16.7% from €36 to €30) and NAV-Portugal (-13.5% from €129 to €112). For NAV Portugal, this reduction mainly reflects a decrease in employer contributions to a pension fund that is specific to ATCOs in OPS.

The unit ATCO employment costs at Pan-European system level amounted to €109 per ATCO-hour in 2014. Figure 2.19 shows the values for this indicator for all the ANSPs. There is a wide range of ATCO-hour employment costs across ANSPs, which is not surprising given the heterogeneity in the social and economic environments across Europe.

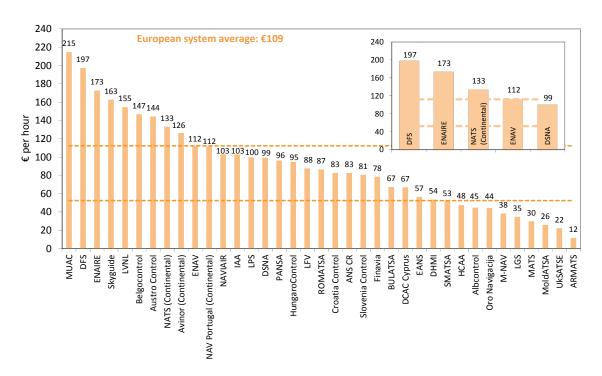

Figure 2.19: ATCO employment costs per ATCO-hour (gate-to-gate), 2014

In 2014, MUAC ATCO employment costs per ATCO-hour (€215) are the highest in Europe, above DFS (€197) and ENAIRE (€173).

A major exogenous factor that underlies differences in unit employment costs is the difference in prevailing market wage rates in the national economies in general. This is also associated with differences in the cost of living. To assess the influence of these exogenous differences, employment costs per ATCO-hour have been examined in the context of Purchasing Power Parity (PPP). The PPPs for 2014, which are available from the EUROSTAT and IMF databases, are reported for each State/ANSP in Annex 7 of this report.

There are some limitations²¹ inherent to the use of PPPs and for this reason the ACE data analysis does not put a significant weight on results obtained with PPPs adjustments. PPPs are nevertheless a useful analytical tool in the context of international benchmarking.

Figure 2.20 below shows the ATCO employment costs per ATCO-hour both **before** and **after** adjustment for PPP. The adjustment reduces the dispersion of this indicator. After PPP adjustment, the average unit employment costs per ATCO-hour amounts to €119 (compared to €109 without adjustment). For many Central and Eastern European ANSPs (e.g. ANS CR, BULATSA, Croatia Control, HungaroControl, LPS, PANSA and ROMATSA) the PPP adjustment brings the unit employment costs close or higher than those operating in Western Europe.

_

²¹ For instance, it is possible that, for a given country, the cost of living in regions where the ANSP headquarter and other main buildings (e.g. ACCs) are located is higher than the average value computed at national level.

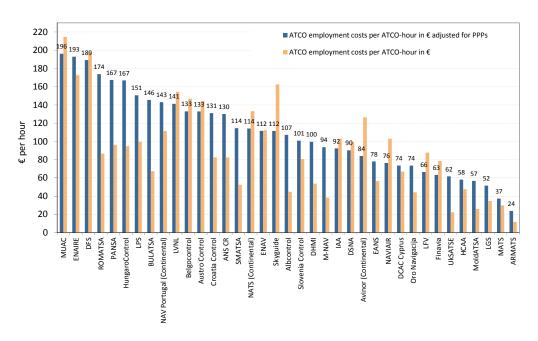

Figure 2.20: Employment costs per ATCO-hour with and without PPPs, 2014

Employment costs are typically subject to complex bargaining agreements between ANSPs management and staff which usually are embedded into a collective agreement. The duration of the collective agreement, the terms and methods for renegotiation greatly vary across ANSPs. In some cases salary conditions are negotiated every year. High ATCO employment costs may be compensated for by high productivity (e.g. MUAC). Therefore, in the context of staff planning and contract renegotiation, it is important for ANSPs to manage ATCOs employment costs effectively and to set quantitative objectives for ATCO productivity.

Figure 2.21 below shows the ATCO employment costs per composite flight-hour in 2014. The ATCO employment costs per composite flight-hour result from the combination of two of the main components of the financial cost-effectiveness indicator: ATCO-hour productivity (see Figure 2.16) and employment costs per ATCO-hour (see Figure 2.19). All other things being equal, lower ATCO employment costs per unit of output will contribute to greater financial cost-effectiveness.

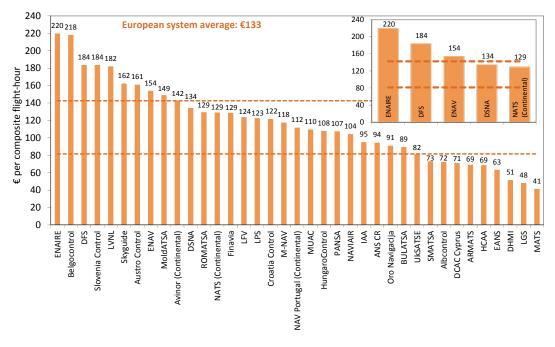

Figure 2.21: ATCO employment costs per composite flight-hour, 2014

In order to provide an insight into the relationship between ATCO-hour productivity and employment costs, Figure 2.22 below presents the ANSPs classified in four quadrants according to their level of ATCO productivity and employment costs. The quadrants are established on the basis of the European average values for these two metrics.

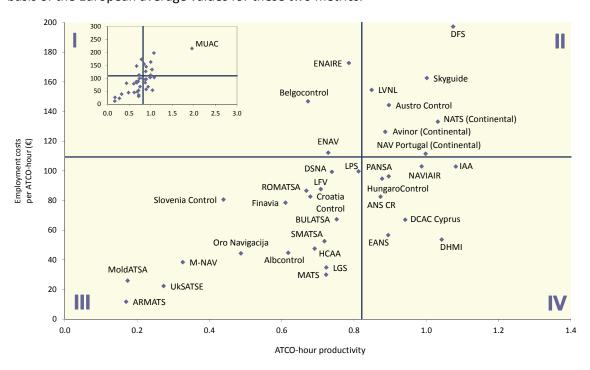

Figure 2.22: Components of ATCO employment costs per unit of output, 2014

An ANSP may have high ATCO employment costs per ATCO-hour but if its ATCOs are highly productive then it will have relatively lower employment costs per composite flight-hour. This is the case for the ANSPs in the top right (Quadrant II) of Figure 2.22 such as MUAC which shows ATCO employment costs per ATCO-hour above the European average but ATCO employment costs per composite flight-hour below the European average (see also Figure 2.21 above).

ENAIRE and Belgocontrol (Quadrant I) combine higher ATCO employment costs with relatively lower ATCO productivity, resulting in higher ATCO employment costs per unit of output (see also Figure 2.21 above).

Some ANSPs such as DHMI (Quadrant IV) have both relatively higher ATCO-hour productivity and lower ATCO employment costs per ATCO-hour (without PPP adjustment).

Finally, ANSPs such as ARMATS, MoldATSA, M-NAV and UkSATSE (Quadrant III) show both lower ATCO-hour productivity and lower ATCO employment costs per ATCO-hour.

More details on the changes in ATCO-hour employment costs for individual ANSPs are provided in Part II of this Report.

In 2014, at Pan-European level, unit support costs fell by -2.4% since support costs remained fairly constant (-0.2%) while traffic rose by +2.3%.

As indicated in Figure 2.23, support costs per composite flight-hours fell by -10.2% between 2009 and 2014 at Pan-European system level (or -2.1% p.a.).

This results from a combination of an increase in the number of composite flight-hours (+1.3% p.a.) and a decrease in support costs (-0.9% p.a.). The latter mainly reflects the impact of the cost containment measures implemented by the Pan-European ANSPs since 2009.

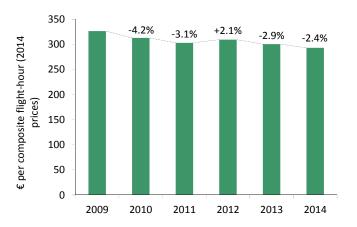

Figure 2.23: Changes in support costs per composite flight-hour, 2009-2014 (real terms)

In 2014, support costs remained fairly constant (-0.2%) while traffic increased by +2.3%. As a result, unit support costs decreased (-2.4%). The main drivers of the changes in support costs are further discussed below.

Contrary to ATCO employment costs, support costs encompass a variety of cost items which require specific analysis. There is a general acknowledgement that the Pan-European system has excessive support costs due to its high level of operational, organisational, technical and regulatory fragmentation.

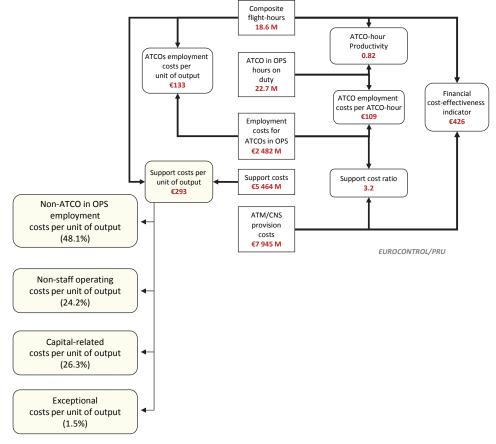

Figure 2.24: Framework for support costs analysis, 2014

As shown in Figure 2.24, support costs can be broken down into four separate components that provide further insight into the nature of support costs:

- a) Employment costs for non-ATCO in OPS staff (48.1% of total support costs); these cover ATCOs on other duties, trainees, technical support and administrative staff. These costs can be affected by the following factors:
 - Outsourcing of non-core activities (such as maintenance of technical equipment, and professional training) could transfer costs from this category to non-staff costs.
 - Research & development policies may involve ATM systems either being developed inhouse, or purchased off-the-shelf. In principle, either solution could lead to the most cost-effective outcome, depending on circumstances; this would depend on whether there were, for example, significant economies of scale, or major transaction costs.
 - Arrangements relating to the collective agreement and the pension scheme for non-ATCOs in OPS.
- **b) Non-staff operating costs** (24.2% of total support costs) mostly comprise expenses for energy, communications, contracted services, rentals, insurance, and taxes. These costs can be affected by the following factors:
 - The terms and conditions of contracts for outsourced activities.
 - Enhancement of the cooperation with other ANSPs to achieve synergies in the context of a FAB (sharing training of ATCOs, joint maintenance, and other matters).
- **c) Capital-related costs** (26.3% of total support costs), comprising depreciation and financing costs for the capital employed. These costs can be affected by the following factors:
 - The magnitude of the investment programme.
 - The accounting life of the assets.
 - The degree to which assets are owned or rented.
- **d) Exceptional costs** which represent some 1.5% of total support costs.

Figure 2.25 shows the changes in the different components of support costs (see the "support costs effect" bar on the right-hand side of Figure 2.12) between 2013 and 2014.

Support costs remained fairly constant in 2014 (-0.2%). This reflects the fact that higher non-staff operating costs (+1.9% or +€24.1M), depreciation costs (+1.8% or +€16.6M) and cost of capital (+3.6% or +€17.8M), were compensated by lower support staff costs (-1.2% or -€32.6M) and exceptional costs (-30.2% or -€34.2M).

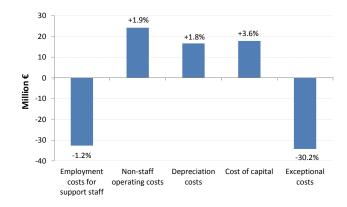

Figure 2.25: Changes in the components of support costs, 2013-2014 (real terms)

Support costs increased for a majority of ANSPs (22 ANSPs out of 37) with particularly large increases observed for ENAV (+10.8% or +€48.8M) and DHMI (+9.6% or +€26.6M).

For ENAV (+10.8% or + $\le 48.8 M$), the main drivers for the increase in support costs are higher support staff costs (+10.2%), non-staff operating costs (+7.1%) and cost of capital (+50.6%) resulting from the use of a much higher weighted average cost of capital (from 2.9% in 2013 to 4.6% in 2014) for en-route ANS.

For DHMI (+9.6% or +€26.6M), the higher support costs mainly reflects increases in the cost of capital (+29.9%), and higher non-staff operating costs (+8.7%).

On the other hand, substantial decreases in support costs are observed for ENAIRE (-6.2% or -€28.0M) and NATS (-12.7% or -€79.8M). In the case of ENAIRE, the main sources of cost

reductions in 2014 were lower non-staff operating costs (-13.2%) and cost of capital (-19.7%) due to the use of lower rates of return on equity and lower interest rates on debt.

For NATS, all support cost categories except depreciation costs decreased between 2013 and 2014. The main driver for the reduction in support costs is due to the fact that NATS had reported relatively high exceptional costs in its 2013 data submission (some €53.0M) which included relatively large amounts of redundancy costs for NERL staff.

As shown in Figure 2.24 above, employment costs is the largest component of support costs. These costs can be significantly affected by the type of pension arrangements, and particularly whether the pension scheme is based on "defined benefits" or "defined contributions". Some ANSPs have already taken decisive actions to deal with future pension obligations, notably changing the pension scheme for new recruits and moving away from "defined benefits" pension plans.

Figure 2.26 breaks down ANSPs staff costs (€5 110M) into different categories. Gross wages and salaries are the main component of total staff costs (76.0%). The second largest category, employer contributions to staff pensions, accounts for 15.4%.

It should be noted that the proportion of pension contributions in total staff costs can significantly differ across the Pan-European ANSPs. These differences mainly reflect the variety of pension arrangements that are in place locally.

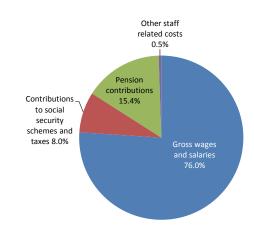

Figure 2.26: Breakdown of ANSPs staff costs, 2014

Support costs represent some 70% of ATM/CNS provision costs and are therefore an important driver of cost-effectiveness performance. In the future, improvements in cost-effectiveness could arise from greater competition for support services which could be available on a central basis, physically distant from the ANSPs HQs and ATC facilities and supported by innovation in IT technology.

At Pan-European system level, support costs per composite flight-hour amounted to €293 in 2014. Figure 2.27 shows that the level of unit support costs varies significantly across ANSPs – a factor of almost four between Belgocontrol (€524) and MUAC (€138)²².

_

²² It should be noted that MUAC uses infrastructure owned by Belgocontrol, DFS and LVNL (see also p.19).

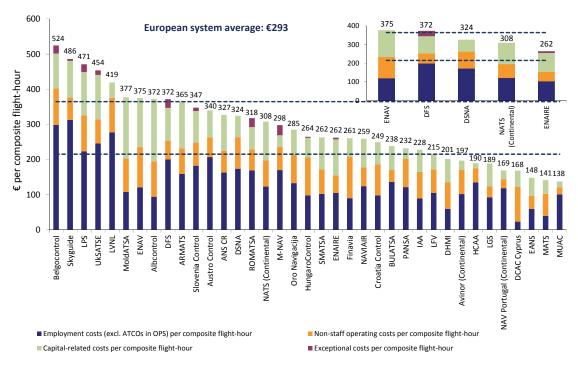

Figure 2.27: Support costs per composite flight-hour at ANSP level²³, 2014

Figure 2.27 indicates that there are significant differences in the composition of support costs amongst the 37 ANSPs, and in particular in the proportion of employment costs (blue bar) and non-staff operating costs (orange bar). The choice between providing some important operational support functions internally or externally has clearly an impact on the proportion of support costs that is classified as employment costs, non-staff operating costs, or capital-related costs. In some cases, the maintenance of ATM systems is outsourced and the corresponding costs are reported as non-staff operating costs. For other ANSPs, these activities are rather carried out by internal staff and the related costs appear as employment costs or as capital-related costs when, according to IFRS, the employment costs of staff working on R&D projects can be capitalised in the balance-sheet.

Figure 2.27 also indicates that in 2014 the unit support costs of various ANSPs operating in Central and Eastern European countries (e.g. Albcontrol, ANS CR, ARMATS, BULATSA, LPS, MNAV, MoldATSA, ROMATSA, Slovenia Control and UkSATSE) are higher than the Pan-European system average and in the same order of magnitude as the unit support costs of ANSPs operating in Western European countries where the cost of living is much higher.

Like ATCO in OPS employment costs, employment costs for the support staff are also affected by the cost of living. Using the same methodology as in Figure 2.20, Figure 2.28 shows the impact of adjusting the non-ATCO in OPS employment costs per composite flight-hour for PPPs.

_

²³ It should be noted that the cost of capital reported by ANS CR in its ACE 2014 data submissions is higher than the costs charged to airspace users. Indeed, ANS CR did not charge any cost of capital to terminal ANS users.

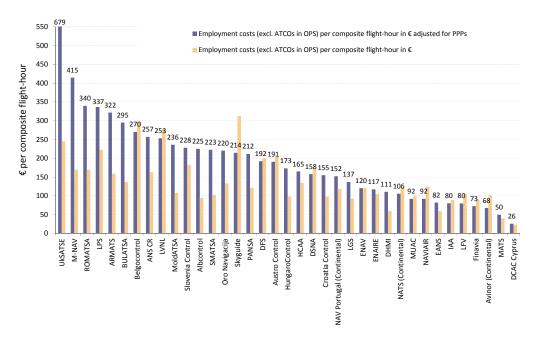

Figure 2.28: Employment costs (excl. ATCOs in OPS) with and without adjustment for PPPs, 2014

After PPP adjustment, the unit employment costs for support staff per composite flight-hour amounts to €160 (compared to €141 without adjustment).

Figure 2.28 indicates that after PPP adjustment, the unit employment costs of many Central and Eastern European ANSPs are generally higher than those operating in Western Europe. As both the cost of living and general wage levels are converging across Europe, there is an upward pressure on employment costs for these ANSPs. In order to sustain the current level of staffing and associated employment costs, it will be of great importance to effectively manage non-ATCO in OPS employment costs.

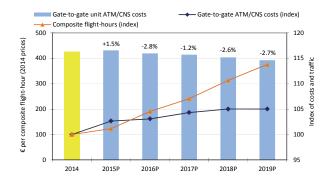

More details on the level and changes in support costs for individual ANSPs are provided in Part II of this Report.

2.9 Forward-looking cost-effectiveness (2015-2019)

At Pan-European System level, the gate-to-gate unit ATM/CNS provision costs are planned to fall by -1.6% p.a. between 2014 and 2019. This mainly reflects the fact that over this period traffic is expected to increase faster (+2.6% p.a.) than ATM/CNS costs provision costs (+1.0% p.a.).

The objective of this section is to provide information on ANSPs planned gate-to-gate unit ATM/CNS provision costs and capex for the period 2015-2019. It is based on data reported by ANSPs in their ACE 2014 submissions. It is important to note that NATS is excluded from this analysis since forward-looking data (based on regulatory accounting rules) and historical data (based on IFRS) are not directly comparable.

Figure 2.29 below shows that, at Pan-European System level, the gate-to-gate unit ATM/CNS provision costs are planned to fall by -1.6% p.a. between 2014 and 2019. This planned decrease is due to the fact that traffic is expected to increase faster (+2.6% p.a.) than ATM/CNS provision costs (+1.0% p.a.).

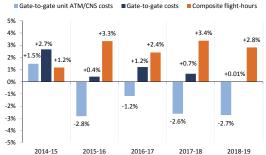

Figure 2.29: Forward-looking cost-effectiveness (2014-2019, real terms)

The decrease in unit costs planned at Pan-European system level masks contrasted situations among ANSPs. Figure 2.30 below shows ANSPs planned changes in unit ATM/CNS provision costs (light blue bars) and identifies the costs (dark blue line) and traffic (orange line) effects.

Figure 2.30 indicates that 16 ANSPs are planning for decreases in unit ATM/CNS provision costs greater than -2.0% p.a. over the 2014-2019 period. This is particularly the case for MoldATSA (-11.3% p.a.), SMATSA (-5.0% p.a.) and PANSA (-4.9% p.a.) who plan for annual decreases in unit costs greater than -4.0%.

- For MoldATSA, the decrease in unit costs is mainly due to a substantial reduction in ATM/CNS provision costs (-11.4% p.a.) while the number of composite flight-hours is expected to remain fairly constant over the 2014-2019 period (-0.1% p.a.).
- For SMATSA, the planned reduction in unit ATM/CNS provision costs (-5.0% p.a.) between 2014 and 2019 reflects the combination of a planned reduction in costs (-2.1% p.a.) with an expected traffic increase (+3.1% p.a.).
- PANSA ATM/CNS provision costs are planned to remain constant between 2014 and 2019 (+0.1% p.a.) while traffic volumes are expected to rise substantially (+5.2% p.a.). As a result, PANSA unit ATM/CNS provision costs are planned to reduce by -4.9% p.a. over the 2014-2019 period.

On the other hand, Figure 2.30 shows that unit ATM/CNS provision costs are expected to rise by more than +4.0% p.a. for three ANSPs between 2014 and 2019:

- For DHMI (+4.5% p.a.), ATM/CNS provision costs are expected to increase faster (+13.2% p.a.) than traffic volumes (+8.3% p.a.).
- MATS (+10.8% p.a.) plan for substantial increases in ATM/CNS provision costs (+10.5% p.a.) in a context of slight traffic decrease (-0.3% p.a.).
- On the other hand, for UkSATSE the planned increase in unit ATM/CNS provision costs (+4.1% p.a.) is mainly due to a sharp decrease in traffic (-11.4% p.a.) while costs are expected to reduce by -7.7% p.a. over the 2014-2019 period. In fact, the number of composite flight-hour controlled by UkSATSE is expected to sharply reduce in 2015 (-57.2%) reflecting a change in traffic flows following the establishment of restricted/prohibited areas in the Ukrainian airspace.

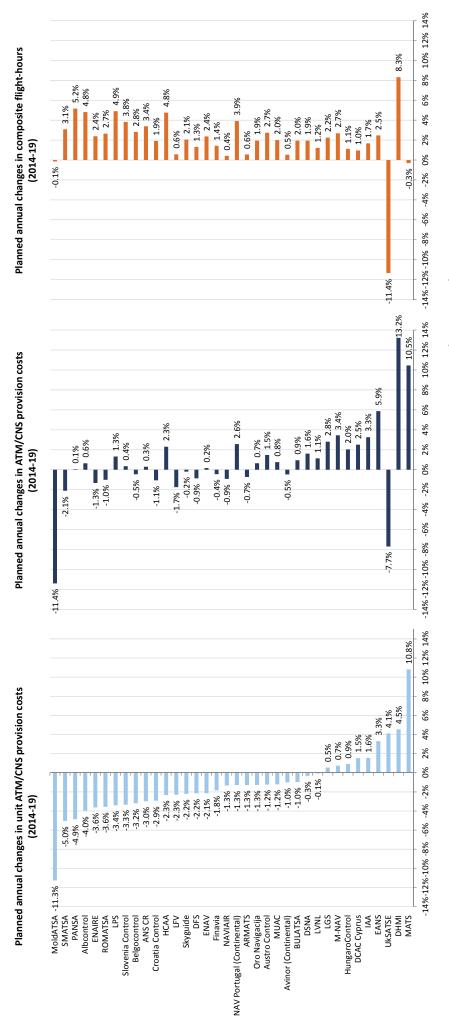

Figure 2.30: Planned changes in unit costs over the 2014-2019 period (real terms)

Figure 2.31 below shows the total actual capex and depreciation costs at Pan-European system level between 2009 and 2014 (including the 37 ANSPs contributing to the ACE report) as well as the planned capex and depreciation costs between 2015 and 2019 for the 36 ANSPs that reported planned capex in their ACE 2014 data submission²⁴. The cumulative capex planned for the period 2015-2019 amounts to some €5 329M or an average of €1 066M per year.

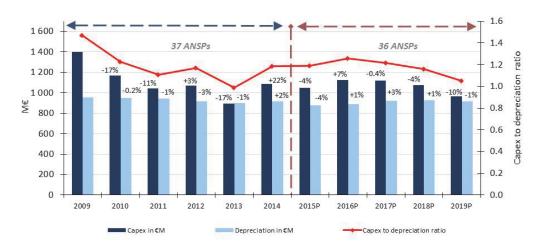

Figure 2.31: Capital expenditures and depreciation costs (2009-2019, real terms)

The average capex to depreciation ratio planned over 2015-2019 (1.17) is in line with that observed over the 2009-2014 period (1.16 excluding NATS). This indicates that, overall, ANSPs asset bases are expected to grow at a similar rate as in the past five years.

Additional information on the nature and magnitude of the major investment projects for each ANSP is provided in Part II of this Report.

²⁴ M-NAV capex is included in Figure 2.31, but only until 2018 since M-NAV did not report planned capex for year 2019. In addition, as explained in the introduction of Section 2.9, NATS is also excluded from the capex and depreciation costs analysis.

3 LONG-TERM CHANGES IN COST-EFFECTIVENESS (2004-2014)

ACE data have been collected since 2001 and it now becomes possible to conduct relevant long-term analysis of ATM cost-effectiveness. It would have been interesting to include the first three years of ACE data submissions (2001-2003) in this analysis. However, given that only 29 ANSPs participated to the ACE 2001 analysis, it has been decided to consider the 2004-2014 period to have a sample with a larger size. Between 2004 and 2014, the number of ANSPs participating to the ACE benchmarking exercise has increased from 34 to 37. For this reason, the results provided in this chapter focuses on the sample of 34 ANSPs for which complete time-series are available AS a consequence, the figures disclosed for the Pan-European system in this Chapter differs from the data presented in Chapter 2, which reflects the information provided by 37 ANSPs over the 2009-2014 period.

A long term view is particularly interesting to examine the trend in cost-effectiveness before the economic crisis (2004-2008) and how the Pan-European ANS industry reacted to the global economic recession which affected the aviation community in 2009.

3.1 Long-term changes in cost-effectiveness at Pan-European system level (2004-2014)

Figure 3.1 shows the long-term trend in ATM/CNS provision costs, traffic measured in terms of composite flight-hours and unit costs between 2004 and 2014. Over the whole period, ATM/CNS provision costs rose by +0.4% p.a. which is significantly less than the +1.4% p.a. increase in traffic. As a result, unit ATM/CNS provision costs per composite flight-hour decreased by -1.0% p.a. between 2004 and 2014. These average changes mask different trends and cycles over the 10-year period.

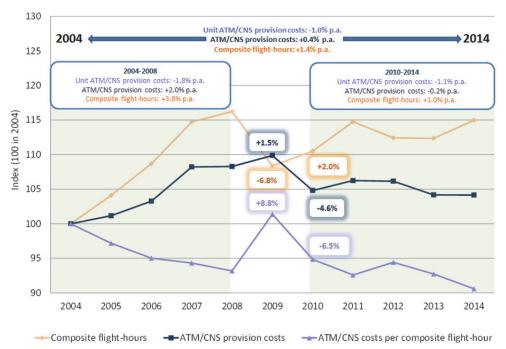

Figure 3.1: Long-term trends in traffic, ATM/CNS provision costs and unit costs

²⁵ The three additional ANSPs joining the ACE benchmarking exercise during the 2004-2014 period were PANSA in 2005, SMATSA in 2006 and ARMATS in 2009.

Between 2004 and 2008, a period of sustained traffic growth, the number of composite flight-hours rose faster (+3.8% p.a.) than ATM/CNS provision costs (+2.0% p.a.). As a result, unit ATM/CNS provision costs reduced by -1.8% p.a. over this period. This demonstrated the ability of the ATM industry to reduce unit costs in a context of robust and continuous traffic growth.

In 2009, the economic recession struck the aviation industry with an unprecedented -6.8% traffic decrease. In the meantime, ATM/CNS provision costs continued to grow by +1.5% reflecting the short-term rigidities to adjust costs downwards and the unavoidable lead time. As a result, unit ATM/CNS provision costs increased by +8.8% and all the cost-effectiveness improvements achieved since 2004 were cancelled out.

In 2010, ATM/CNS provision costs reduced by -4.6% in a context of a +2.0% increase in traffic. It should be emphasised that before 2010, ATM/CNS provision costs had never declined during the decade. This reflects the impact of the cost containment measures implemented by a majority of ANSPs in the wake of the sharp traffic decrease in 2009. This indicates that, as a whole, the ATM industry was reactive and showed flexibility to adjust costs downwards in response to the fall in traffic. It is interesting to note that this performance improvement was achieved when ANSPs operated under the so-called full-cost recovery regime which provided no strong incentives to reduce/contain costs.

Between 2010 and 2014, ATM/CNS provision costs remained fairly constant in a context of low traffic growth (+1.0% p.a. compared to +3.8% over the 2004-2008 period). As a result, unit ATM/CNS provision costs reduced by -1.1% p.a. between 2010 and 2014.

Overall, ANSP cost-bases have reduced by some -€47.9M (-0.6%) between 2010 and 2014. Figure 3.2 below shows that this slight decrease reflects the combination of higher ATCO employment costs (+€93.5M or +4.0%) and lower support costs (-€141.4M or -2.6%).

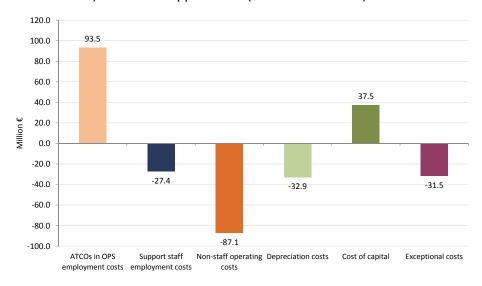

Figure 3.2: Breakdown of changes in ATM/CNS provision costs (2010-2014)

Figure 3.2 indicates that the decrease in support costs over the 2010-2014 period is mainly due to lower support staff costs (-€27.4M or -1.1%), non-staff operating costs (-€87.1M or -6.4%), depreciation costs (-€32.9M or -3.5%), exceptional costs (-€31.5M or -28.5%) while the cost of capital rose by +€37.5M (+8.1%).

The implementation of the Performance Scheme in 2012 and the financial incentives embedded in the Charging Scheme were important drivers for this improvement since the ANSPs operating in SES States had strong interests in outperforming their cost-efficiency targets and adapt more rapidly than in the past to fluctuations in traffic. It is important to note that this performance improvement was achieved while reducing ATFM delays (as shown in Chapter 2, see Figure 2.5).

Overall, despite the impact of the economic recession of the ATM industry in 2009, the cost-effectiveness performance of the Pan-European system significantly improved since 2004. Indeed, in 2014 unit ATM/CNS provision costs are -9.4% lower than in 2004. This performance improvement should be seen in the light of (a) the cost-containment measures initiated in 2009-2010 which continued to generate savings years after their implementation, and (b) for the ANSPs operating in SES States, the implementation of the Performance Scheme and the incentive mechanism embedded in the charging scheme which contributed to change the economic behaviour of these ANSPs and to maintain a downward pressure on costs during RP1.

3.2 Long-term changes in the components of cost-effectiveness (2004-2014)

As indicated in Figure 2.11 on p.23, the cost-effectiveness indicator is broken down into three main components: ATCO-hour productivity, ATCO employment costs per ATCO-hour and support costs per composite flight-hours. Figure 3.3 below shows the long-term changes for these indicators over the 2004-2014 period.

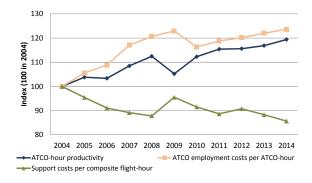

Figure 3.3: Long-term trends in productivity, employment costs per ATCO-hour and unit support costs

Figure 3.3 shows the long-term changes for these indicators over the 2004-2014 period. Employment costs per ATCO-hour (+2.1% p.a.) rose slightly faster than ATCO productivity (+1.8% p.a.). In the meantime, unit support costs fell by -1.5% p.a. since support costs remained fairly constant in a context of traffic increase (+1.4% p.a.).

As a result, unit ATM/CNS provision costs reduced by -1.0% p.a. over the 2004-2014 period.

The following sections analyse in further details the changes in ATCO-hour productivity (section 3.2.1), ATCO employment costs per ATCO-hour (section 3.2.2) and support costs per composite flight-hours (section 3.2.3) over the 2004-2014 period.

3.2.1 ATCO-hour productivity

Figure 3.4 shows that the increase in ATCO-hour productivity over the 2004-2014 period (\pm 1.8% p.a.) results from the combination of a \pm 1.4% p.a. traffic growth with a small reduction of ATCO-hours on duty (\pm 0.4% p.a.).

Although ATCO-hour productivity significantly reduced in 2009 (-6.4%), it substantially increased in 2010 (+6.7%) following a -4.5% decrease of ATCO-hours on duty. As explained on p.24, these results are heavily influenced by the structural changes implemented in 2010-2011 by ENAIRE.

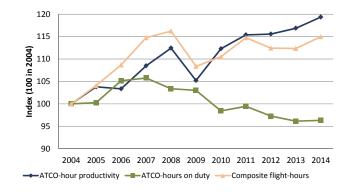

Figure 3.4: Long term trends in ATCO-hour productivity

ATCO-hour productivity rose by +1.5% p.a. between 2010 and 2014, and as a result, the Pan-European system productivity in 2014 is +19.4% higher than in 2004.

Figure 3.5 shows that over the 2004-2014 period, improvements in ATCOhour productivity were proportionally higher for ANSPs starting with relatively low productivity levels in 2004 (see green dots in Figure 3.5). Indeed, ATCO-hour productivity rose by +4.1% p.a. for ANSPs starting below the median of the sample in 2004. A robust traffic growth for those ANSPs (+5.9% p.a.) significantly contributed to the observed improvement but this was not the only factor since these ANSPs also managed to decrease ATCO-hours on duty (-2.3% p.a.).

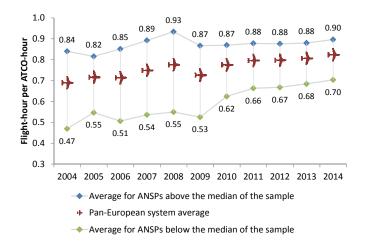

Figure 3.5: Convergence in ATCO-hour productivity levels between 2004 and 2014

In other words, these ANSPs could serve an increasing traffic with the same or a reduced number of ATCOs in OPS.

On the other hand, the productivity increase for ANSPs starting with relatively high levels in 2004 (see blue dots in Figure 3.5) is much lower (+0.6% p.a.). As a consequence, the substantial gap in ATCO-hour productivity observed between the two ANSP groups in 2004 (79%) significantly reduced over the years to reach 27% in 2014. This result is an indication of the convergence in ATCO-hour productivity that took place over the last ten years in the ATM industry.

3.2.2 Employment costs per ATCO-hour

Figure 3.6 shows that the increase in employment costs per ATCO-hour over the 2004-2014 period (+2.1% p.a.) is due to the fact that ATCO employment costs rose by +1.8% p.a. while ATCO-hours on duty slightly reduced (-0.4% p.a.). Following the implementation of costcontainment measures and the structural changes in ENAIRE. employment costs per ATCO-hour significantly reduced in 2010 (-5.4%) and then continuously rose until 2014 (+1.5% p.a.).

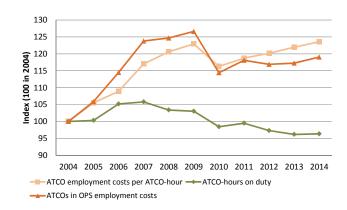

Figure 3.6: Long term trends in employment costs per ATCO-hour

Significant increases in ATCO employment costs per ATCO-hour (+6.9% p.a.) are observed for ANSPs starting with relatively low ATCO employment costs in 2004 (see green dots). This is significantly faster than for ANSPs starting with relatively high levels of ATCO employment costs in 2004 (+1.8% p.a.).

This illustrates the gradual convergence of employment costs in the European economies following the strengthening of the economic integration and enhanced labour mobility.

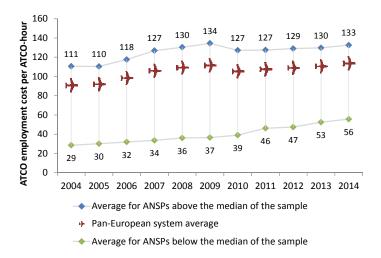

Figure 3.7: Convergence of ATCO employment costs per ATCO-hour between 2004 and 2014

As a result, the substantial gap in employment costs per ATCO-hour observed between the two ANSP groups in 2004 (factor 2.9) significantly reduced over the years to reach a factor 1.4 in 2014.

3.2.3 Support costs per composite flight-hour

Figure 3.8 below indicates that the decrease in unit support costs over the 2004-2014 period (-1.5% p.a.) is mainly due to the fact that support costs remained fairly constant in a context of traffic increase (+1.4% p.a.).

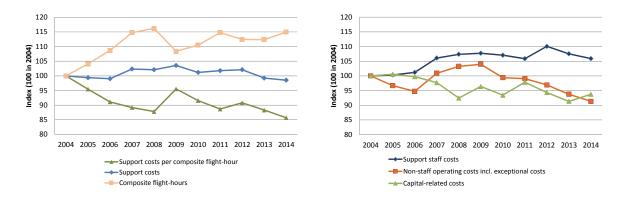

Figure 3.8: Long-term trends in support costs per composite flight-hour

The right-hand side of Figure 3.8 shows that between 2004 and 2014, the increase in support staff costs (+0.6% p.a.) was compensated by reductions in non-staff operating costs (-1.1% p.a.) and capital-related costs (-0.6% p.a.).

Support staff costs represent some 48% of ANSPs support costs. Trends in employment costs are determined by the changes in the number of staff and in the average employment costs per staff. Figure 3.9 below shows the changes in the number of support staff (Full-Time Equivalents) at Pan-European system level and in average support staff employment costs over the 2004-2014 period.

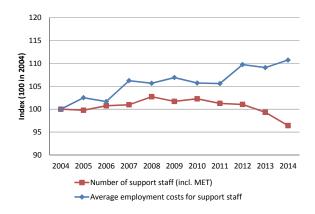

Figure 3.9: Long-term trends in support staff costs and FTEs

Figure 3.9 below breaks down the support staff costs into its two components: the number of support staff and the average employment costs for support staff. In order to ensure consistency in time series analysis, the data provided in Figure 3.9 include information relating to internal MET staff.

Figure 3.9 indicates that the increase in support staff costs over the 2004-2014 period reflects an increase in unit employment costs for support staff (+1.0% p.a.) while the number of support staff reduced by -0.4% p.a.

Figure 3.10 below shows the changes in support staff for the five largest ANSPs over the 2004-2014 period. At the exception of DFS, support staff reduced for all the five largest ANSPs: DSNA, ENAIRE, ENAV and NATS.

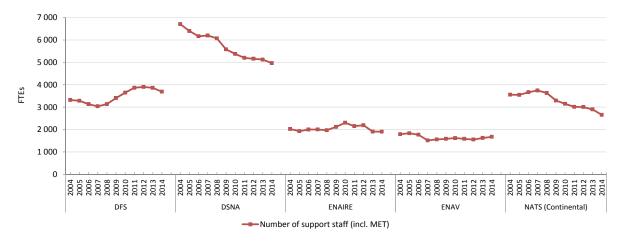

Figure 3.10: Long-term trends in support staff for the five largest ANSPs

Figure 3.10 indicates that the number of DSNA support staff substantially reduced between 2004 and 2014 (-26.0% or -1 743 FTEs). It is noteworthy that the substantial decrease observed in 2009 (-492 FTEs) mainly reflects the fact that, following institutional changes, staff working in the ENAC (Ecole National de l'Aviation Civile, around 420 FTEs at the time) were not reported in DSNA ACE data submission from 2009 onwards.

After a +5.3% increase over the 2004-2007 period, NATS support staff reduced by -29.1% to reach a level which is -900 FTEs lower than in 2004. This reflects the implementation of staff redundancy programme following structural changes in NATS. The latest staff reduction programme was launched in 2013 for NATS En-route Limited (NERL) and NATS Services employees. It is understood that over 240 employees are expected to leave in the context of this programme.

ENAIRE (-5.9% or -119 FTEs) and ENAV (-6.5% or -116 FTEs) achieved support staff reductions over the 2004-2014 period. For ENAIRE, the decrease in support staff is mainly associated to the 2010-2014 period (-399 FTEs). This reduction should be seen in the light of (a) the restructuration that took place in Spain in 2011 (transfer of Aena airport management activities to Aena Aeropuertos), and (b) the implementation of a social plan for voluntary lay-offs which was initiated in 2013.

DFS support staff rose by +17.6% over the 2004-2012 period and then reduced in 2013 (-1.1% or -41 FTEs) and 2014 (-4.5% or -172 FTEs). The decrease in the number of support staff observed in

2014 should be seen in the context of the "increase in productivity" element of the Five-point programme set by DFS Board of Managing Directors. This programme set up in 2013 is expected to generate cost-effectiveness improvements until 2019.

It is clear that due to their weight, the support staff reductions achieved by four of the five largest ANSPs, and in particular DSNA (-1 743 FTEs) and NATS (-900 FTEs), substantially contribute to the changes observed at Pan-European system level (-1 359 FTEs).

This being said, significant decreases in support staff were also observed for ANSPs with a much lower weight in the system average. This is for example the case for Belgocontrol (-31.2% or -243 FTEs) and LVNL (-18.6% or -164 FTEs). It is understood that the support staff reductions observed for these two ANSPs mainly relate to staff reduction programmes which were initiated in 2011 for Belgocontrol and 2008-2009 for LVNL.

More details on the changes in support costs for individual ANSPs are provided in Part II of this report.

PART II: COST-EFFECTIVENESS PERFORMANCE FOCUS AT ANSP LEVEL

Thile page is left blank integrationally for principles is left blank. Integrationally

4 FOCUS ON ANSPS INDIVIDUAL COST-EFFECTIVENESS PERFORMANCE

4.1 Objective of this chapter

This chapter comprises two pagers for each ANSP participating to the ACE 2014 analysis. These two pagers include an analysis of the historical development of the financial cost-effectiveness indicator and its main components over the 2009-2014 period. Individual ANSP cost-effectiveness performance is also examined in the context of a group of ANSPs which operate in relatively similar operational and economic environments (comparator groups). Finally, these two pagers comprise historical information and projections about capital expenditures provided by each ANSP.

4.2 Historical development of cost-effectiveness performance, 2009-2014

The first page presents, for each ANSP, an assessment of its cost-effectiveness performance, and how it has developed over the five-year period 2009-2014. It examines the overall economic cost-effectiveness indicator and its two components (ATM/CNS costs per composite flight-hour, ATFM delay costs per composite flight-hour), and their evolution over the period (top left). It puts these in the context of the traffic growth observed in the ANSP's airspace (top right). In this page, financial data are all expressed in real terms (2014 prices).

Developments in the components of financial cost-effectiveness (ATCO-hour productivity, ATCO employment costs per ATCO-hour, and support costs per composite flight-hour) are also examined (middle left), to help understand the underlying causes of changes in overall cost-effectiveness.

The charts on the middle right provide additional information in order to better understand the drivers behind the changes in the three components of financial cost-effectiveness. First, the changes in ATCO-hour productivity are examined in the light of changes in composite flight-hours, number of FTE ATCOs in OPS and corresponding hours on duty. A second chart focuses on the changes in ATCO-hours on duty, and in particular on overtime hours. The third chart presents the changes in support costs are broken down into employment costs of staff other than ATCOs in OPS; non-staff operating costs; capital-related costs (depreciation and the cost of capital); and exceptional items, where present.

The bottom set of graphs examine how the changes in the components over the whole period contribute to the change in the overall financial cost-effectiveness indicator. The left-hand graphs relate to ATCOs in OPS; the right-hand graphs to other elements of cost ("support costs"). The left-hand graphs show how the change in ATCO productivity combines with the change in unit ATCO employment costs to make a change in ATCO employment costs per unit output. The right-hand graphs show how the change in support costs combines with traffic growth to make a change in support costs per composite flight-hour. The relative contribution of these two effects to the change in the financial cost-effectiveness indicator depends on the relative weight of ATCO employment costs, on the one hand, and support costs, on the other, in the overall ATM/CNS provision costs.

The presentation of financial time-series data

Presentation and comparison of historical series of financial data from different countries poses problems, especially when different currencies are involved, and inflation rates differ. There is a danger that time-series comparisons can be distorted by transient variations in exchange rates which happened to be particularly the case in 2009 in the wake of the financial crisis. In this chapter, the focus is on the historical development of financial performance indicators in a given ANSP.

For this reason, the following approach has been adopted for allowing for inflation and exchange rate variation. The financial elements of performance are assessed, for each year, in **national** currency. They are then converted to national currency in 2014 prices using national inflation rates. Finally, for comparison purposes in 2014, all national currencies are converted to euros using the 2014 exchange rate.

This approach has the virtue that an ANSP's performance time series is not distorted by transient changes in exchange rates over the period. It does mean, however, that the performance figures for any ANSP in a given year prior to 2014 are not the same as the figures in that year's ACE report, and cannot legitimately be compared with another ANSP's figures for the same year. Cross-sectional comparison using the figures in this report is only appropriate for 2014 data.

The historical inflation figures used in this analysis were obtained from EUROSTAT or from the International Monetary Fund. For the projections, the ANSPs' own assumptions concerning inflation rates were used. Details of the monetary parameters used for 2014 are given in Annex 7 to this report.

4.3 ANSP's cost-effectiveness within the comparator group, 2009-2014

The top charts of the second page present the financial cost-effectiveness indicator and its main components for individual ANSPs in comparison with their respective comparator group. The approach is to consider each ANSP in the context of a group of other ANSPs (comparators) which operate in relatively similar operational and economic environments.

The chart on the top-left shows the level and changes in unit ATM/CNS provision costs over the 2009-2014 period for each ANSP part of the comparator group. The chart on the top-right shows for each ANSP the deviations in unit ATM/CNS provision costs, ATCO-hour productivity, employment costs per ATCO-hour and unit support costs from the average of the comparator group at the start (2009) and at the end (2014) of the period considered.

The ANSP comparator groups used for the benchmarking analysis are presented in the table below. These comparator groups were determined for the purposes of the RP2 cost-efficiency target-setting process using a two-step approach combining the use of statistical tools (cluster analysis) with expert judgement. For a full description of the process, methodology and results see Annex I.C of the PRB report on RP2 EU-Wide Targets Ranges²⁶ released in May 2013.

Nine groups of comparators have been identified, some comprising a relatively large number of ANSPs and others only comprising two organisations. Due to the unique nature of its airspace (upper airspace only, across four States), it was determined that Maastricht (MUAC) should be considered separately and therefore this ANSP was not included in the comparator group benchmarking analysis. Finally, two groups have been designed for the ANSPs not operating in SES States. It should be noted that the names of these groups have been chosen for mnemonic purposes only.

4.4 Historical and forward-looking information on capital investment projects

The charts which are displayed in the middle and the bottom of the second page provide historical information and projections about capital expenditures provided by each ANSP.

The chart on the middle of the page shows the historical and planned evolution of capital expenditure and depreciation, highlighting the ANSP's investment cycles and their magnitude, across time. The ratio of these quantities (usually greater than one) is an indication of the rate at which the overall asset base is being expanded.

Finally, two tables present information on the nature of the main ANSP's capex projects between 2009 and 2019. The first table provides a high-level overview of the magnitude of historic and planned capital expenditures by area (i.e. ATM, Communication, Surveillance, etc.) and of the upgrade/replacement cycles of the main ATM systems for each ACC. The capex allocation by area is not always straightforward, especially when ANSPs report under a large project several smaller

investments relating to different areas. The classification disclosed in this report therefore reflects the PRU understanding based on information provided by ANSPs during the validation process. In case of a project covering several areas, the rationale was to classify the whole project into the domain where the investment project was mostly contributing. The last table provides detailed information on the top 5 capex projects in monetary terms including the domain, the financial amount and the time period of the project. For ANSPs operating in SES States, this information is based on data provided in RP2 Performance Plans which is subject to change before the final adoption of the Performance Plans.

4.5 Cost-effectiveness performance focus at ANSP level

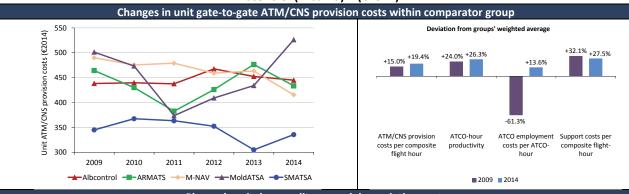

To facilitate the reading of this section, the table below displays the page number of the individual benchmarking analysis for each ANSP.

Changes in unit gate-to-gate ATM/CNS provision costs within comparator group

Due to the unique nature of its airspace (upper airspace only, across four States), it was decided that Maastricht (MUAC) should be considered separately and therefore this ANSP is not included in the comparator group benchmarking analysis

Planned capital expenditures and depreciation costs

ANNEX 2 – PERFORMANCE INDICATORS USED FOR THE COMPARISON OF ANSPS

The output measures for ANS provision are, for en-route, the en-route flight-hours controlled²⁷ and, for terminal ANS, the number of IFR airport movements controlled. In addition to those output metrics, it is important to consider a "gate-to-gate" perspective, because the boundaries used to allocate costs between en-route and terminal ANS vary between ANSPs and might introduce a bias in the cost-effectiveness analysis²⁸.

For this reason, an indicator combining the two separate output measures for en-route and terminal ANS provision has been calculated. The "composite gate-to-gate flight-hours" are determined by weighting the output measures by their respective average cost of the service for the whole Pan-European system. This average weighting factor is based on the total monetary value of the outputs over the period 2002-2014 and amounts to 0.27.

The composite gate-to-gate flight-hours are consequently defined as:

Composite gate-to-gate flight-hours = En-route flight-hours + (0.27 x IFR airport movements)

In the ACE 2001-2006 Reports, two different weighting factors were used to compute ANSPs cost-effectiveness: one for the year under study and another to examine changes in performance across time. As the ACE data sample became larger in terms of years, the difference between these two weighting factors became insignificant. For the sake of simplicity, it was therefore proposed in the ACE 2007 Benchmarking Report to use only one weighting factor to analyse ANSPs performance for the year and to examine historical changes in cost-effectiveness.

Although the composite gate-to-gate output metric does not fully reflect all aspects of the complexity of the services provided, it is nevertheless the best metric currently available for the analysis of gate-to-gate cost-effectiveness²⁹.

The quality of service provided by ANSPs has an impact on the efficiency of aircraft operations, which carry with them additional costs that need to be taken into consideration for a full economic assessment of ANSP performance. In this ACE Benchmarking Report, an indicator of "economic" cost-effectiveness is computed at ANSP and Pan-European system levels by adding the ATM/CNS provision costs and the costs of ATFM ground delay, all expressed per composite flight-hour. This computation is shown in the Table below (see column 10).

²⁷ Controlled flight-hours are calculated by the Network Manager (NM) as the difference between the exit time and entry time of any given flight in the controlled airspace of an operational unit. Three types of flight-hours are currently computed by the NM (filed model, regulated model and current model). The data used for the cost-effectiveness analysis is based on the current model (Model III or CFTM) and includes flight-hours controlled in the ACC, APP and FIS operational units which are described in the NM environment.

²⁸ See also working paper on "Cost-effectiveness and Productivity Key Performance Indicators", available on the PRC web site at www.eurocontrol.int/prc.

²⁹ Further details on the theoretical background to producing composite indicators can be found in a working paper on "Total Factor Productivity of European ANSPs: basic concepts and application" (Sept. 2005).

Annex 2 - Table 0.1: Economic cost-effectiveness indicator, 2014

The cost of ATFM delay in this report is based on the <u>European airline delay cost reference values</u>, published by the University of Westminster. Based on the initial work published in 2004³⁰, the report has been updated in 2010 to improve the methodology and to take changes in the economic and regulatory environment into account. In each new ACE report, the PRU expresses the cost of one minute of ATFM delay in the price base of the year under review, using the average European Union inflation rate published by EUROSTAT (e.g. in the ACE 2013 report, the €81 per minute corresponding to the 2010 value amounted to €87 when expressed in 2013 prices).

In December 2015, a further updated has been published to update the 2010 delay costs with 2014 values³¹. Based on this latest update, the estimated average European ATFM delay cost have been adjusted from €81 per minute (2010 value) to €100 per minute (2014 value). The increase in estimated ATFM delay costs is mainly driven by an increase in passenger delay costs (rebooking, compensation and care, etc.) which is the single largest group of costs, followed by reactionary, crew and maintenance costs. ATFM delays are only marginally affected by changes in jet fuel price as they primarily occur at the gate.

More detailed information can be found in the updated University of Westminster report, available for download on the PRC web-page (www.eurocontrol.int/prc).

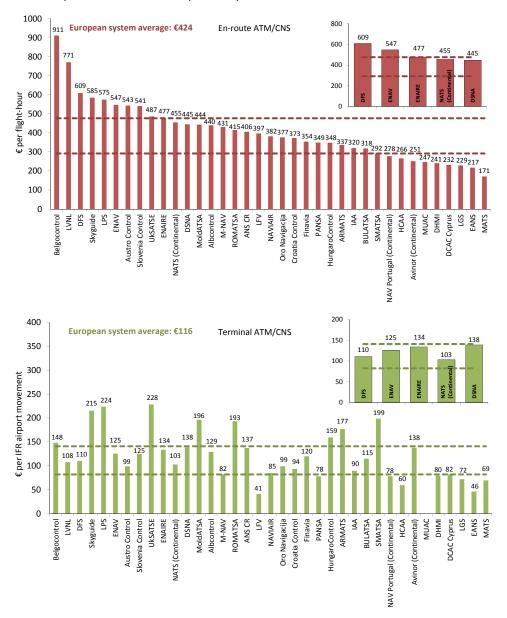

_

³⁰ Evaluating the true cost to airlines of one minute of airborne or ground delay (May 2004).

European airline delay cost reference values (December 2015), available at: http://www.eurocontrol.int/publications/european-airline-delay-cost-reference-values.

It should be noted that the ATFM delays included in the ACE data analysis reflect all delay causes (e.g. capacity, weather, etc.). Detailed information on causes of ATFM delays at ACC level is provided in the PRC Performance Review Reports.

For the sake of completeness, the gate-to-gate financial cost-effectiveness indicator shown in the Table above (see column 8) is broken down into en-route and terminal components. To facilitate the comparison and interpretation of the results, ANSPs are ranked according to the en-route cost-effectiveness indicator. The output units in the Figure below are en-route flight-hours and IFR airport movements, respectively.

Annex 2 - Figure 0.1: Breakdown of financial cost-effectiveness into en-route and terminal

The Figure above shows that there are cases where a high en-route cost per flight-hour (top graph) corresponds to a low terminal cost per IFR airport movement (bottom graph) and vice versa. For example SMATSA has relatively high unit costs in terminal service provision but relatively low unit costs in en-route.

It is difficult to determine whether these differences are driven by economic and operational factors (for example, size of operations, economies of scale, or traffic complexity), or purely cost-allocation differences, which are known to exist across States/ANSPs.

For this reason, the focus of the cost-effectiveness benchmarking analysis in this report is "gate-to-gate".

Thile page is left blank integrationally for principles is left blank integrationally

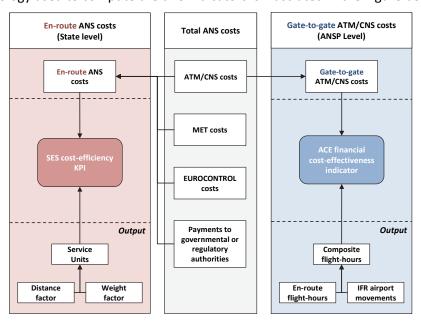

ANNEX 3 – ACE COST-EFFECTIVENESS INDICATOR AND SES COST-EFFICIENCY KPI

The objective of this Annex is to explain the main differences between the ACE financial cost-effectiveness indicator and the Single European Sky (SES) en-route cost-efficiency KPI (as defined in Regulation (EU) N°390/2013).

First of all, it should be noted that these two indicators have been specified in response to different needs:

- The purpose of ACE is to benchmark the cost-effectiveness performance of ANSPs in providing gate-to-gate ATM/CNS services (where en-route and terminal ATM/CNS are considered together). The ACE financial cost-effectiveness indicator is computed as the ratio of ATM/CNS provision costs to composite flight-hours and it can be broken down into three components (ATCO-hour productivity, ATCO employment costs per ATCO-hour and unit support costs). These components allow interpreting the differences in cost-effectiveness performance observed across Pan-European ANSPs. The ACE benchmarking analysis also informs ATM stakeholders on the level and trends of the Pan-European system cost-effectiveness performance.
- The en-route cost-efficiency KPI (the Determined Unit Cost or DUC), which is defined in the Performance Scheme regulation, is used as part of the SES cost-efficiency performance target-setting and monitoring processes. This KPI is computed as the ratio of en-route ANS costs (in real terms) to service units at charging zone level, and reflects the costs of several entities, not only the ANSP. The en-route ANS costs (in nominal terms) and service units also form the basis to calculate the unit rate that is billed to airspace users within a charging zone.

The methodology used to compute the two indicators is illustrated in the Figure below.

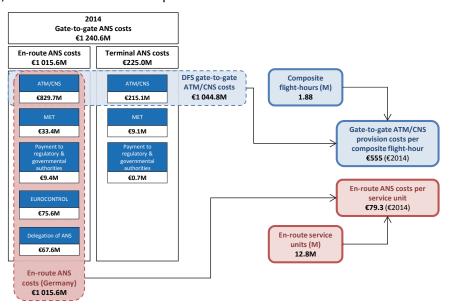

Annex 3 - Figure 0.1: ACE cost-effectiveness indicator and SES cost-efficiency KPI

As shown in the Figure above, the main differences between the ACE financial cost-effectiveness indicator and the SES en-route cost-efficiency KPI are the following:

 Operational scope: En-route and terminal costs are considered together when benchmarking the economic performance of ANSPs in the ACE analysis. As explained in Annex 2 above, it is important to consider a "gate-to-gate" perspective, because the boundaries used to allocate costs between en-route and terminal ANS vary between ANSPs and might introduce a bias in the cost-effectiveness analysis. On the other hand, the SES cost-efficiency KPI is computed for en-route and terminal ANS separately, for the purposes of the target-setting and/or monitoring processes.

- Service scope: Total ANS costs (including costs relating to the ANSPs, METSPs, EUROCONTROL, and NSAs) are used to compute the SES cost-efficiency KPI, while only the ANSPs ATM/CNS provision costs are included in the ACE benchmarking analysis.
- Measure of the output: The output metric used to compute the SES en-route costefficiency KPI is the number of en-route service units³². This metric is a function of the
 aircraft weight and of the distance flown within a given charging zone. This is the metric
 which has been historically used to compute the en-route unit rate charged to airspace
 users. On the other hand, the ACE financial cost-effectiveness indicator is computed using
 composite flight-hours³³, which combine both flight-hours and IFR airport movements as
 detailed in Annex 2 above. It should be noted that the geographical area controlled by
 ANSPs operational units can substantially differ from the charging zones in case of
 delegation of ANS. The composite flight-hours therefore better reflect the operational
 activity performed by ANSPs, while service units are more appropriate when charging
 zones are considered.

The Figure below provides a concrete example of reconciliation between the ACE financial cost-effectiveness indicator and the en-route costs per service unit³⁴. It uses as an example the ACE 2014 data provided by DFS and the 2014 actual en-route costs and service units provided by Germany for the purposes of the Enlarged Committee for Route Charges in November 2015. In both cases, financial information is expressed in €2014.

Annex 3 - Figure 0.2: Example of reconciliation between ANSP unit gate-to-gate ATM/CNS provision costs and a charging zone unit en-route ANS costs (2014)

³² Service unit = distance flown $\times \sqrt{\frac{MTOW}{50}}$

³³ Further details on the calculation of the metric can be found in Annex 2 of this report.

³⁴ It should be noted that the costs reported in the UK Performance Plans and charged to en-route airspace users are based on regulatory accounting rules. This is different from the methodology used by NATS to report historic and actual ATM/CNS provision costs which are based on IFRS accounting.

ANNEX 4 – PERFORMANCE RATIOS

This Annex summarises the relationship between the three multiplicative components financial cost-effectiveness (ATCOhour productivity, employment costs per ATCO-hour and support cost ratio) and the two complementary components (ATCO employment costs per composite flight-hour and the support cost per composite flighthour), described in Chapter 2. To facilitate the interpretation of the results, the concept of the "performance ratio" has been introduced.

The **performance ratios** represent the relationship between the value for an ANSP of an indicator and the value of that indicator for the Pan-European system as a whole. Performance ratios are defined such that a value greater than one implies a performance better than the European average, the positive terms of contribution it makes to cost effectiveness. An ANSP with the same performance as the Pan-European system will have a performance ratio of **one**.

			Perfo	ormance ra	atios	Performa	nce ratios

Annex 4 – Table 0.1: The components of gate-to-gate costeffectiveness, 2014³⁵

ANSPs for which a given component makes a particularly positive contribution to its cost-effectiveness (more than 1.30) are highlighted in green – those where a given component makes a particularly low contribution (less than 1/1.30) are in orange.

Some ANSPs more than make up for a relatively low contribution from one component by a relatively high contribution from another and, as a result, are more cost-effective than the average (cost-effectiveness index greater than 1).

effectiveness.

³⁵ For the ATCO employment costs per ATCO-hour, the support costs ratio, the ATCO employment costs per composite flight-hour and the support costs per composite flight-hour (asterisked in the Table above), the inverse ratio is used, since **higher** unit employment costs and **higher** support costs imply **lower** cost-

On the left-hand-side the three ratios are multiplicative; the product of the ratios for each of the components equals the performance ratio for overall financial cost-effectiveness (see financial cost-effectiveness index). The following example for ENAIRE illustrates the interpretation of the performance ratios:

0.88	ENAIRE's gate-to-gate ATM/CNS costs per composite flight-hour are +13% higher (1/0.88 - 1) than the European average.
= 0.96	ATCO-hour productivity is -4% lower than the European average.
x 0.63	The ATCO employment costs per ATCO-hour of ENAIRE are +58% higher (1/0.63 - 1) than the European average.
x 1.46	Support cost ratio is -31% lower (1/1.46 - 1) than the European average.

On the right-hand-side, the two complementary performance ratios are normalised using the European average (note that these ratios are neither multiplicative nor additive):

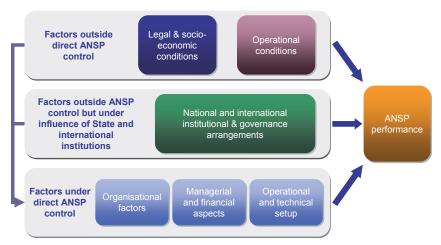

0.61	ENAIRE's ATCOs in OPS employment costs per composite flight-hour are +65% higher (1/0.61 - 1) than the European average, while
1.12	The support costs per composite flight-hour are -11% lower (1/1.12 - 1) than the European average.

ANNEX 5 – FACTORS AFFECTING PERFORMANCE

The ACE benchmarking analysis has the objective of comparing ATM cost-effectiveness performance across a wide range of ANSPs. The major focus of this report is to examine and analyse the quantitative facts about the observed cost-effectiveness performance of the ANSPs. This factual analysis provides a comprehensive description and comparison of performance as viewed by the users of ATM/CNS services.

However, such a factual analysis cannot be either a complete explanation of performance differences between ANSPs, or an exhaustive guide on how performance can be improved, without some complementary consideration of how differences in performance arose.

The framework illustrated in the Figure below, which was first introduced in the ACE 2007 Benchmarking Report, shows **exogenous** and **endogenous** factors which influence ANSP performance.

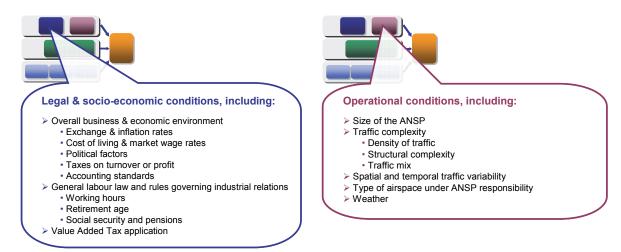

Annex 5 - Figure 0.1: Factors affecting cost-effectiveness performance

Exogenous factors are those outside the control of an ANSP whereas endogenous factors are those entirely under the ANSP's control.

Exogenous factors have been classified into two main areas according to which decision-makers have an influence over them. In particular, exogenous factors comprise:

• legal and socio-economic conditions (for example taxation policy), and operational conditions (for example traffic patterns the ANSP has to deal with) that are affected by decision makers and conditions outside aviation policy-making.

• institutional and governance arrangements such as international requirements imposed by the Single European Sky, that are influenced by aviation sector policy decisions.

The endogenous factors presented in Figure 0.1 above can be classified into three groups that should be taken into account in the scope of a comprehensive analysis of ANSPs' influence on performance:

- Organisational factors such as the internal organisation structure.
- Managerial and financial aspects such as the collective bargaining process.
- Operational and technical setup such as the operational structure.

Organisational factors, including:

- Internal organisational structure
 - Degree of centralisation
 - · Optimisation of internal processes
- Corporate culture
- Extent of in-house ownership and activities
 - Leasing, renting, owning assets
 - Research & development policy
 - Outsourcing non-core activities
- Human resources
 - Recruitment and training
 - Staff/management relationships
 - Internal communication
- Relationship with the customers
 - · Arrangements for customer consultation
 - Disclosure of audited financial statements

Managerial & financial aspects, including:

- ANSP management
 - •Top-management leadership and actions
 - Performance oriented management
- Collective bargaining process
- Financial and accounting aspects
 - Business planning process
 - Investment policy
 - Balance sheet structure
 - Depreciation policy

Operational & technical setup, including:

- Operational organisation
- Operational concepts and processes
 - Airspace and sector design
 - ASM, ATFM or ATFCM
 - Civil/military arrangements
- Operational flexibility
 - ATM systems & equipments
 - Human/system interaction

A more comprehensive description and analysis of the performance framework illustrated in this Annex is available in Chapter 3 of the ACE 2009 Benchmarking Report³⁶.

Document available on the PRC website (http://www.eurocontrol.int/publications/atm-cost-effectiveness-ace-2009).

Annex 7 - Table 0.1: 2014 Exchange rates, inflation rates and PPPs data

Presentation and comparison of historical series of financial data from different countries poses problems, especially when different currencies are involved, and inflation rates differ. There is a danger that time-series comparisons can be distorted by transient variations in exchange rates.

For this reason, the following approach has been adopted in this Report for allowing for inflation and exchange rate variation. The financial elements of performance are assessed, for each year, in national currency. They are then converted to national currency in 2014 prices using national inflation rates. Finally, for comparison purposes in 2014, all national currencies are converted to Euros using the 2014 exchange rate.

This approach has the virtue that an ANSP's performance time series is not distorted by transient changes in exchange rates over the period. It does mean, however, that the performance figures for any ANSP in a given year prior to 2014 are not the same as the figures in that year's ACE report, and cannot legitimately be compared with another ANSP's figures for the same year. Cross-sectional comparison using the figures in this report is only appropriate for 2014 data.

The exchange rates used in this Report to convert the 2014 data in Euros are those provided by the ANSPs in their ACE data submission.

The historical inflation figures used in this analysis were obtained from EUROSTAT³⁷ or from the International Monetary Fund³⁸ when the information was not available in EUROSTAT website. For the projections (2015-2019), the ANSPs' own assumptions concerning inflation rates were used.

Purchasing Power Parities (PPPs) are currency conversion rates that are applied to convert economic indicators in national currency to an artificial common currency (Purchasing Power Standard (PPS) for EUROSTAT statistics). The PPPs data used to adjust most of the ANSPs employment costs in Chapter 2 of this report was extracted from EUROSTAT.

For three countries (Armenia, Moldova and Ukraine), PPP data was not available in the EUROSTAT database. In these cases, the IMF database was used. Since in the IMF database, the PPPs are expressed in local currency per **international Dollar** rather than **PPS**, an adjustment has been made so that the figures used for Armenia, MoldATSA and UkSATSE are as consistent as possible with the data used for the rest of the ANSPs. The assumption underlying this adjustment is that the difference in PPPs between two countries shall be the same in the EUROSTAT and in the IMF databases.

According to the IMF database, there is a factor of 5.17 between the PPPs for Ukraine (4.255 UAH per international Dollar in 2014) and the PPPs for France (0.823 Euro per international Dollar). This factor is applied to the PPPs for France as disclosed in the EUROSTAT database (i.e. 1.10) to express the PPPs for Ukraine in PPS (5.69 = 1.10×5.17). A similar methodology is used to express Moldova and Armenia PPPs in PPS.

Annex 8 - Table 0.3: Breakdown of ATM/CNS provision costs³⁹ (en-route, terminal and gate-to-gate), 2014

39 ENAIRE 2014 ATM/CNS provision costs comprise costs relating to ATM/CNS infrastructure shared with the military authority (€16.1m), which are charged to civil airspace users. It should be noted that these costs, which are borne by Spanish military authority, are not passing through ENAIRE accounts from 2014 onwards

ANNEX 9 – PERFORMANCE INDICATORS AT FAB LEVEL

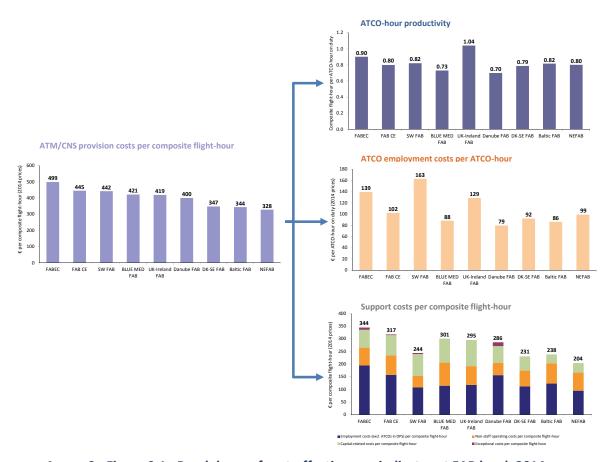

The first part of this Annex provides a breakdown of the **financial** cost-effectiveness indicator at FAB level by ATCO-hour productivity, ATCO employment costs per ATCO-hour and support costs per composite flight-hour. The second part provides an initial estimate of economic cost-effectiveness at FAB level including both the costs of ATFM delays and the costs of horizontal enroute flight inefficiency. It also provides a brief description of the methodology used to estimate the costs of flight inefficiencies.

The figures shown at FAB level have been computed taking into account the ANSPs participating to the ACE analysis in 2014 and which were formally part of a FAB initiative:

- FABEC: Belgocontrol, DFS, DSNA, LVNL, MUAC and Skyguide.
- <u>FAB CE</u>: ANS CR, Austro Control, Croatia Control, HungaroControl, LPS and Slovenia Control.
- SW FAB: ENAIRE and NAV Portugal.
- BLUE MED: DCAC Cyprus, ENAV, HCAA and MATS.
- UK-Ireland: IAA and NATS.
- <u>Danube</u>: BULATSA and ROMATSA.
- DK-SE: LFV and NAVIAIR.
- Baltic: Oro Navigacija and PANSA.
- NEFAB: Avinor, EANS, Finavia and LGS.

Breakdown of financial cost-effectiveness indicator by FAB (2014)

The Figure below represents a break-down of unit ATM/CNS provision costs into ATCO-hour productivity, ATCO employment costs per ATCO-hour and unit support costs at FAB level.

Annex 9 - Figure 0.1: Breakdown of cost-effectiveness indicator at FAB level, 2014

Estimated costs of horizontal en-route flight inefficiencies by FAB (2014)

The analysis of horizontal en-route flight efficiency is based on the length of the actual flight trajectory. In order to enable consistent comparisons between city pairs and between different areas (which include only a portion of the trajectory), the length is expressed as additional distance with respect to the corresponding achieved distance (see blue box).

For instance, an "inefficiency" of 5% for a flight of 1 000 NM means that the extra distance was 50 NM.

The actual flown trajectory is based on processed radar track data (Correlated Position Reports) submitted by ANSPs to the EUROCONTROL Enhanced Tactical Flow Management System (ETFMS).

Horizontal en-route flight efficiency

Horizontal en-route flight efficiency compares the length of actual flight trajectories to the corresponding "achieved" distance. The achieved distance apportions the Great Circle Distance (GCD) between two points within the European airspace. For the vast majority of flights, the origin and destination coincide with the airports. If the origin/destination airport is located outside of European airspace, the entry/exit point into the reference area is used for the calculation.

The methodology enables to better quantify between local inefficiency (deviations between entry and exit point within a respective airspace such as FAB, ANSP, ACC) and the contribution to the network (deviation from GCD between origin and destination airport).

The methodology for the calculation of horizontal enroute flight efficiency applied in this Annex is fully consistent with the Single European Sky (SES) Performance Scheme.

En-route flight inefficiencies are predominantly driven by:

- route network design;
- route availability;
- route utilisation (route selected by airspace users); and,
- ATC measures.

It is acknowledged that the distance-based flight efficiency indicators only serve as proxies for fuel efficiency as the most fuel efficient route depends on wind. However, even the wind-optimal route might not necessarily correspond to the choice of the airspace users because they might use different measures based on total costs (time, unit rates, etc.).

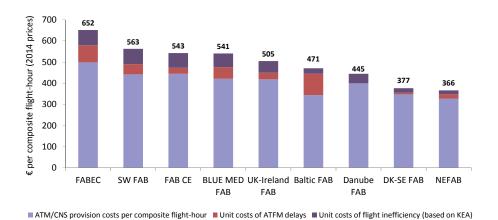

Despite their limitations, the flight efficiency indicators used in this section provide consistent and stable measures at Pan-European system level to identify areas for improvement and to monitor progress over time.

Further information on the methodology used to compute the horizontal en-route flight efficiency indicator can be found online at: www.ansperformance.eu.

The Figure below presents the unit economic cost-effectiveness at FAB level when adding both the costs of ATFM delay⁴⁰ and the estimated costs of flight inefficiency to ATM/CNS provision costs.

Annex 9 — Performance indicators at FAB level ACE 2014 Benchmarking Report with 2015-2019 outlook

 $^{^{40}}$ Information on the assumptions underlying the calculation of costs of ATFM delays can be found in Annex 2 of this Report.

Annex 9 - Figure 0.2: Unit economic cost-effectiveness at FAB level including flight inefficiencies, 2014

Estimating the costs to airspace users of ANS-related flight inefficiencies is a complex exercise including numerous assumptions and expert judgement. A first step is to convert the additional distances into additional times and additional fuel consumptions (see Table below).

	Flight inefficiency (% additional distance)	Additional distance (M km)	Additional time (days)	Additional fuel (ktons)
UK-Ireland FAB	3.6%	22	1 287	79
FABEC	3.2%	90	4 942	289
SW FAB	3.1%	30	1 628	98
BLUE MED FAB	2.5%	28	1 527	94
FAB CE	1.9%	18	930	61
Baltic FAB	1.8%	3	160	10
NEFAB	1.4%	3	181	10
Danube FAB	1.3%	5	255	21
DK-SE FAB	1.2%	4	214	12

Annex 9 - Table 0.1: Estimated impact of flight inefficiencies on time and fuel consumption

Then, in order to translate additional time and additional fuel consumption into monetary terms, two main sources of information are used:

- The **cost of time** is estimated using the University of Westminster study⁴¹ (the same study as that used to estimate the cost of ATFM delays). However, although the same reference study is used, the value of one minute of ATFM delay is not the same as the value of one minute of flight inefficiency as the cost items entering in the calculations have to reflect the different nature and specificities of the two indicators.
- The **cost of fuel** is estimated from information provided by IATA. It is based on the average annual spot price and also includes an estimated average premium paid by airspace users on top of the spot price as well as a provision for fuel carriage penalties.

As explained above, estimates of the cost of flight inefficiencies at FAB level have not yet reached the same level of maturity as the other ACE performance indicators and further work will be required before validating the inclusion of fight inefficiencies in the ACE economic cost-effectiveness indicator (which currently only adds the cost of ATFM delays to the financial cost-effectiveness indicator).

European airline delay cost reference values (December 2015), available at: http://www.eurocontrol.int/publications/european-airline-delay-cost-reference-values.

Institutional arrangements and links (2016)

Status (2016)

- Joint-stock company as of 1996. Currently 14 shareholders; 99,91% is held by the Swiss Confederation which by law must hold at least 51%
- Integrated civil/military as of 2001

National Supervisory Authority (NSA):

Federal Office for Civil Aviation (FOCA)

Body responsible for:

Safety Regulation

Federal Office for Civil Aviation

Airspace Regulation

Federal Office for Civil Aviation

Economic Regulation

The Ministry of the Environment, Transport, Energy and Communications

Corporate governance structure (2016)

GENERAL ASSEMBLY of the Shareholders

SUPERVISORY BOARD (7 members) Chairman + 6 members All members are appointed by the General Assembly for their expertise.

EXECUTIVE BOARD (7 members)
CEO + 6 members
The CEO is appointed by the Supervisory Board.

Skyguide (2016)

CHAIRMAN OF THE SUPERVISORY BOARD: Walter T. Vogel

DIRECTOR GENERAL (CEO):

Daniel Weder

Scope of services (2014)

✓ GAT	Upper Airspace	Oceanic ANS
✓ OAT	✓ Lower Airspace	

- ATC services delegated to Geneva ACC by France

Operational ATS units (2014)

2 ACCs (Geneva, Zurich)

4 APPs (Geneva, Zurich, Lugano, Bern)

7 TWRs (Geneva, Zurich, Lugano, Bern, Buochs, Altenrhein, Grenchen)

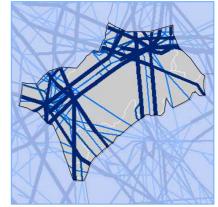

Key financial and operational figures (ACE 2014)

Gate-to-gate total revenues (M€)	331
Gate-to-gate total costs (M€)	317
Gate-to-gate ATM/CNS provision costs (M€)	292
Gate-to-gate total ATM/CNS assets(M€)	282
Gate-to-gate ANS total capex (M€)	45
ATCOs in OPS	362
Gate-to-gate total staff	1 347
Total IFR flight-hours controlled by ANSP ('000)	323
IFR airport movements controlled by ANSP ('000)	481
En-route sectors	18
Minutes of ATFM delays ('000)	611

Size (2014)

Size of controlled airspace:

69 700 km²

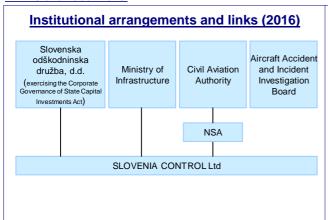

SLOVENIA CONTROL, Slovenia

Slovenia Control Ltd

www.sloveniacontrol.si

Status (2016)

- Since 2004 the SLOVENIA CONTROL, Slovenian Air Navigation Services, Ltd, as a 100% state-owned enterprise is independent of national supervisory authorities.

National Supervisory Authority (NSA):

Civil Aviation Authority

Body responsible for:

Safety Regulation

Ministry of Infrastructure and Spatial Planning

Airspace Regulation

Ministry of Infrastructure and Spatial Planning

Economic Regulation

Slovenska odškodninska družba, d.d. (exercising the Corporate Governance of State Capital Investments Act)

Corporate governance structure (2016)
